Sewage treatment at Austin, Minnesota. FREDERIC BASS. *Eng. News-Record* **97,** 339-42(1926).—Following the rejection of plans for a direct oxidation installation, the town of Austin, Minn., has constructed a 1.33-million gals. per day plant consisting of Imhoff tanks, percolating filters, Dorr clarifier and sludge-drying bed, at a cost of $220,000. The flow is about 1 million gallons per day from a population of 12,000. R. E. THOMPSON

Chlorination studies being continued at Schenectady, New York. M. M. COHN. *Eng. News-Record* **97,** 436–7(1926).—Additional chlorinating equipment has been secured and the entire flow of 9 million gallons per day is being chlorinated at the inlet to the Imhoff tanks at the rate of 6 p. p. m. The treatment has been effective in destroying odors from the tanks. Application of 20–30 p. p. m. of Cl to the trickling filters for 48 hrs. removed the film from the surface of the beds and reduced the no. of psychoda flies It is believed that occasional treatment of filters to prevent formation of fresh film will effectively control the flies. R E. THOMPSON

Effect of chlorination on trickling sewage filters. M. M. COHN. *Eng. News-Record* **96,** 943–8(1926).—The results of extensive studies on the effect of chlorination on trickling filters at Schenectady, in which Cl dosages of 4–41 p. p. m. were employed, are summarized as follows: (1) nitrification is not improved, nor permanently or materially destroyed; (2) the tank effluent is rendered practically sterile; (3) the normal filter odors are reduced proportionately to the amt. of Cl applied; (4) biological growths are removed from the nozzles and distribution pipes; (5) the film is removed from the surface of the filters, preventing pooling and production of odors from putrefaction of the film; (6) the no. of psychoda flies present is reduced by the destruction of the film, which is their breeding ground; (7) the suspended and colloidal solids in the effluent are increased when 10 p. p. m. or more of Cl is applied, due to removal of film and sloughing of this material through the filter. Periodical application of $CaOCl_2$ will control the development of the psychoda flies and remove growths from nozzles, reducing the tendency of the beds to pool, without destroying the nitrifying efficiency of the filter. A dichlorobenzene mixt., "Solvent 75," when sprayed on walls, etc., will destroy psychoda, mosquitoes and young spiders. R. E. THOMPSON

Schenectady sewage chlorination studies. ANON. *Eng. News-Record* **96,** 1035–6 (1926).—Discussion of expts. on chlorination of trickling filters at Schenectady (cf. preceding abstract) by H. P. Eddy, F. W. Mohlman and Willem Rudolfs, and reply to the same by M. M. Cohn. E. and M. question the economic practicability of the treatment and R. discusses the theory of chem. disinfection and points out that the increase in colloidal material in the effluent indicates that the Cl was inhibitory to the putrefying organisms present in the filter. C. states recent expts. indicate that chlorination of raw sewage can be carried out more economically than chlorination of the tank effluent. Further studies are being conducted. R. E. THOMPSON

Effect of chlorine on the absorption of dissolved oxygen by polluted waters. P. GAUNT AND W. E. ABBOT. *J. Soc. Chem. Ind.* **45,** 323–4T(1926).—Cl reduces the absorption of dissolved O. Increased dilns. cause the effect to disappear. It is rec-

ommended that effluents might be chlorinated where the dissolved O of the dilg. water is not sufficient to take care of the effluents. K. C. BEESON

Experiences with chlorine treatment of water and sewage. G. ORNSTEIN. *Z. angew. Chem.* **39,** 1035-7(1926).—Chlorination of raw water at Hamburg to kill the algae reduced filter washing 75%. 1.5 p. p. m. of Cl were used and only a slight dosage was required on the filtered water. Chloramines increase the effectiveness of Cl treatment. K. C. BEESON

Sewage sludge marketed for 3 years at Schenectady, N. Y. M. M. COHN. *Eng. News-Record* **97,** 252-4(1926).—The settling solids in the Schenectady sewage are removed and digested in Imhoff tanks, and dried on sand and gravel filters. The digested sludge, which contains 95% water, cracks within 48 hrs. and dries to a forkable condition in 7 days under favorable conditions. The shrinkage in vol. during drying averages 65%. The dried cake has a moisture content of 60-70%, which is reduced to about 45% in the storage piles. A total of 2287 cu. yds. of dried sludge was produced during the summer of 1924 and 2848 cu. yds. in 1925, contg. 0.33-0.98% N, 1.5-1.81% H_3PO_4, 54% org. matter and 5% ether-sol. matter. Most of the grease is removed by the aid of rain and sunlight. The sludge is an excellent fertilizer and an appreciable market has been developed at a nominal charge of 25¢ per load. R. E. THOMPSON

Early days of separate sludge digestion. H. W. CLARK. *Eng. News-Record* **96,** 1031(1926).—A brief discussion of the history of separate sludge digestion and of the work of the Lawrence Expt. Sta. in relation to the same. R. E. THOMPSON

Separate sludge-digestion system for small town use. JERRY DONOHUE. *Eng. News-Rec.* **96,** 690(1926).—The sewage treatment plant of Hartford, Wis., which consists of a bar screen, Dorr clarifier, sludge digester and sludge-drying bed, is described and illustrated, and brief tabulated details are given of 9 other similar plants. Provision has been made for installation of an aeration unit, should further purification be necessary. The digester was seeded with old horse manure. During operation for 1 year the drying beds, which consist of 3 in. of fine sand on 18 in. of broken stone, were only used twice. The sludge dried in 5-7 days in each instance. The town is sewered on the separate system, the flow to the treatment works being 0.4 million gals. per day. R. E. THOMPSON

Toledo intercepting sewers. III. Discharge works. H. P. JONES. *Eng. News-Record* **96,** 718-21(1926).—The pumping station, elliptical skimming tank and submerged outfall at Toledo are described and illustrated. As a result of the sewage works improvements the dissolved O_2 content of the water of Ten Mile and Swan Creeks has increased from 0 to 70% satn. R. E. THOMPSON

Detention periods for sewage tanks operated in parallel. R. T. REGESTER. *Eng. News-Record* **97,** 153(1926).—A diagram is given for estg. the no. and capacity of settling tanks required for given flows and detention periods. R. E. THOMPSON

Apparatus for activated-sludge tests at Essen, Germany. F. SIERP. *Eng. News-Record* **97,** 505(1926).—A brief description of app. for activated-sludge expts., consisting of a glass aquarium divided into settling and aerating compartments (cf. *C. A.* **20,** 1292). R. E. THOMPSON

New activated-sludge plant at Essen, Germany. KARL IMHOFF. *Eng. News-Record* **97,** 298-9(1926).—An activated-sludge unit has been added to the works treating the sewage from that part of Essen which drains to the Ruhr River. The plant, which treats 5.8 million gallons per day from a population of 45,000, now consists of coarse racks, a shallow grit chamber, Imhoff tanks, aeration tanks and final sedimentation tanks. A spiral motion is induced in the flow through the aeration tanks by paddles, the surface aeration thus effected being augmented by compressed air applied through diffuser plates. Compressed air alone may be employed but the air required is then 0.7-1.0 cu. ft. per gallon compared with 0.14 when the paddles are employed, the power consumption being 22 and 8 h. p., resp. R. E. THOMPSON

Activated-sludge plant for three small California cities. F. M. VEATCH. *Eng. News-Record* **97,** 10-3(1926).—An illustrated description of the activated-sludge plant under construction to serve Pomona, Claremont and La Verne, Cal., designed on the basis of an av. and max. flow of 1.5 and 2.25 million gallons per day, resp., from a population of 20,000. The plant consists of an Imhoff tank, aeration tanks, final settling tank equipped with Dorr clarifiers, chlorination tank in which the effluent not used for irrigation will be chlorinated, sludge reaeration tank and sludge-drying bed. The excess activated sludge will be returned to the Imhoff tank for digestion. The total cost of the plant was $111,651.

Recovery of gas from the Decatur Imhoff tanks. WM. D. HATFIELD. *Eng. News-Record* **96,** 645(1926).—The sewage of Decatur consists of 5 million gals. per day

of domestic sewage and 8–12 million gals. per day of waste from starch works. The former, as judged by the biochem. O_2 demand, is equiv. to a population of 40,000, and the latter is equiv. to 350,000. Measurements of the gas generated in the Imhoff tanks indicate an av. production of 180,000 cu. ft. per day. The gas is composed of CH_4 70–80, CO_2 and N_2 20–30, and H_2S 0.1–1.0%. The calcd. calorific value is approx. 700 B.t.u per cu. ft. About 14 cu. ft will generate 1 brake h. p. in a combustion engine. R. E. THOMPSON

Determination of the degree of pollution of the atmosphere. D'ARSONVAL AND F. BORDAS. *Compt rend.* **182,** 823–5(1926).—A modification of the Owen app. has been devised which will be described in a later paper. Its sanitary importance is discussed. C. G. KING

The problem of domestic wastes. FETTWEIS. *Technique sanit.* **20,** 289(1925).—Belgian practice. PIOT. *Ibid* 285.—Swiss practice. J. J. H., JR.

Removal, treatment and utilization of domestic wastes in France. FREMOND. *Technique sanit.* **20,** 272–85(1925). JACK J. HINMAN, JR.

Chemical characteristics of some trade wastes. A. M. BUSWELL, R. E. GREENFIELD AND A. R. SHIVE. *Ind Eng. Chem.* **18,** 1082(1926).—Analyses of wastes from pea and corn canneries, strawboard, paper and roofing factories, distilleries and of domestic sewage are given. K. C. BEESON

Disposal of some organic trade wastes. EDWARD BARTOW. *Ind. Eng. Chem.* **18,** 1085(1926).—Dried packing-house sludge contains 6–8% N, but no satisfactory method has been found for dewatering and drying it. KCl, K_2SO_4, KNO_3, betaine-HCl, and glutamic acid have been made or recovered from beet-sugar wastes. Waste utilization in starch factories has reduced the org. content of effluents in some cases said to be less than 0.5% of the corn used. K. C. BEESON

Partial evaporation of trade waste eliminates taste in water. R. L. MCNAMEE. *Eng. News-Record* **97,** 95–6(1926).—Creosote taste in the water supply of Escanaba, Mich., drawn from Little Bay de Noc, was traced, by sampling through the ice, to a chem. works discharging a considerable vol. of wood-distn. waste. An arbitrary measure of the intensity of the taste producing constituents, termed the taste index, was employed, being the no. of thousand parts of water to which 1 part of the sample will impart a perceptible taste. Waste from a Myers still, which had a taste index of 300, was found to be responsible for 96% of the taste, although its vol. was only 1% of the total waste of the plant. Evapn. of 10% of this waste eliminated 96% of the taste-producing substances. Thus by evapg. 0.1% of the total waste of the plant, 92% of the taste-producing constituents were removed. R. E. THOMPSON

Developments in the field of industrial wastes in relation to water supply. A. L. FALES, *et al. J. Am. Water Works Assoc.* **16,** 302–29(1926).—The connection between coke-oven wastes and chlorophenol tastes and odors in water is discussed. D. K. FRENCH

Treatment of packing-house, tannery, and corn-products wastes. F. W. MOHLMAN. *Ind. Eng. Chem.* **18,** 1076–81(1926).—Exptl. results show that packing-house wastes should be treated by the activated-sludge process, tannery wastes by screening, settling, and diln. with domestic sewage, and corn-products wastes by trickling filters. K. C. BEESON

Admixture of irritants in hydrocyanic gas disinfection with especial reference to the use of chloropicrin as a danger indicator in zyklon C. THEODOR POHL AND BRUNO TESCH. *Desinfektion* **11,** 88–90(1926).—A danger indicator must resist decompn. by the wall materials. $ClCO_2Me$ had to be abandoned as not sufficiently stable. A mixt. of 10 parts (by wt.) HCN, 1 part chloropicrin and 0.3 parts CH_2BrCO_2Et is recommended as safe for the disinfection of apartments without the necessity of vacating the adjoining apartments, provided the usual precautions are observed and the wall material is sufficiently non-porous to warrant a safe HCN disinfection. J. J. SKINNER

Future trends in soil conservation. J. G. LIPMAN. *Ind. Eng. Chem.* **18,** 1034–40(1926). E. J. C.

A general discussion of base exchange in soils. W. P KELLEY. *J. Am. Soc. Agron.* **18,** 450 8(1926) —A general discussion There is danger of trying to explain too much by ion exchange in soils F. M. SCHERTZ

Electrodialysis of the colloidal soil material and the exchangeable bases. SANTE MATTSON *J. Agr. Research* **33,** 553–67(1926) —Electrodialysis of 2 soil colloids which were representative of widely different groups of colloidal soil material showed that the quantity of bases that can be removed by this method is fairly definite and that the order in which the bases appear in the cathode chamber is Ca, K and Na, Mg, Al, Mn and Fe The total quantity of bases that electrodialysis removed from 1 colloid was about 5 times that removed from the other, and the results showed that the various bases are characterized by different degrees of removability. The proportion of the total Ca or Mn removed in this way was much greater than the proportion of Mg, K or Na, and the proportion of the total Al or Fe removed was still less Extn. of the 2 colloids with N NH_4Cl or 0 05 N HCl gave almost identical quantities of the univalent and bivalent bases with that obtained by electrodialysis. Treatment of the electrodialyzed colloids with a $CaCl_2$ soln developed quantities of acidity that approximated the base exchange capacities of the untreated colloids from which it appears that in the process of electrodialysis there is a substitution of H ions from the water for most of the univalent and bivalent cations removed by the elec. current Conclusion: Each of the univalent and bivalent bases in the colloid is present in 2 conditions which are defined as exchangeable and nonexchangeable The quantity of the exchangeable bases that can exist as cations in an outer Helmoltz layer surrounding the particle is considered It is pointed out that if the deductions involved in formulas connecting elec. migration with electrokinetic potential and charge of the particles are correct, only a part of the exchangeable bases in the colloid is present in the dissocd. condition W. H. ROSS

Nature of the colloidal soil material. P. L. GILE. *Third Colloid Symposium Monograph* **1925,** 216–27; cf *C A.* **19,** 3338 —Colloidal soil material consists chiefly of silica, alumina, iron, org matter, so-called "combined" water (not driven off at 110°), and smaller quantities of Mg, K, Ca, Ti, Na, P and Mn. Ten analyses show that no theory of its nature can be framed on constancy of compn. X-ray spectrographs show that the colloid is not wholly amorphous. A dispersed particle of soil colloidal material acts like a loose mosaic of mixed ingredients with an internal pore space Replaceable bases are mainly held at the surfaces presented by silica and org. matter JEROME ALEXANDER

The colloid chemistry of soils. EMIL TRUOG. *Third Colloid Symposium Monograph* **1925,** 228–40, cf. *C A* **19,** 3339 —A review covering soil acidity, formation and chem. nature of soil colloids and their function A new ***ultrafilter*** and a ***colorimetric method of detg. p***$_H$ ***in soils*** are described, the latter to replace the uncertain electrometric method JEROME ALEXANDER

The power of soils to absorb water from air. F. J. ALWAY. *Third Colloid Symposium Monograph* 1925, 241–6 - The view of Sir Humphry Davy (1814) that "the power of soils to adsorb water from air is much connected with fertility" seems to be fully substantiated; but "it does not appear yet satisfactorily established that the ability of soils to adsorb water vapor is a reliable measure of their colloid content." JEROME ALEXANDER

Method of counting soil bacteria according to their physiological groups. A. S. RAZOVMOV. *Trav. Inst. Fertilisants* (Moscow) 1925, No 82, 3-20; *Chimie et industrie* **16,** 127(1926).—R adopted a slightly modified Hiltner-Stromer method, as follows: shake thoroughly 100 g of soil with 100 g of H_2O in a sterilized 1-l. flask, dil. 1 cc. in 9 cc. H_2O, and distribute in 10 small flasks contg 9 cc of selective nutritive medium, sp. for each bacterium studied Incubate at 28 30° for 10-4 days for *Azotobacter,* 20–5 days for nitrifying bacteria, and 30 days for denitrifiers (*B. van iterson*). Beijerinck's medium for *Azotobacter* and a Ca tartrate medium for *B. stutzeri* gave excellent results; but the results were not so good with Winogradski's medium for nitrifying bacteria and with a cellulose medium for *B. van iterson* The soils in the neighborhood of Moscow contain 0–40,000 *Azotobacter* per g The distribution according to physiol. groups of the microflora in the fields of Dolgoproudni was: *Azotobacter* 0–800, nitrifying

bacteria 40,000–100,000, *B. van iterson* 40,000–70,000, *B. stutzeri* 400,000–600,000 per g. Increasing the CaO content by 2.46–24.6 tons per 1.1 hectare, and therefore also the alky. of the soil, increased the *Azotobacter* up to 1800, nitrifying bacteria up to 200,000, *B. stutzeri* up to 800,000 and *B. van iterson* up to 900,000 per g. Addn. of both CaO and fertilizers increased both the denitrifying bacteria and the *Azotobacter*. A soil with high CaO and org. matter contents contains a typical strain of *Azotobacter;* while others contain a slightly pigmented strain which does not form a film in a mannitol soln. The no. of *Azotobacter* varies with the seasons, being least in Sept. and Nov., while in Dec. it is the same as during the first half of the summer. A. P.-C.

Vegetation experiments on soil acidity. MITSCHERLICH. *Landw. Vers. Sta.* **104,** 158–64(1925).—The reaction of some soils, as judged by lab. tests may vary greatly under different conditions. To overcome this and other difficulties, a method involving vegetation expts. is proposed to provide a basis for practical recommendations as to liming and suitable fertilizing of individual soils. The effect of heavy applications to the soil of physiologically acid and alk mixts. of fertilizers on both an acid-sensitive plant (mustard) and an alkaki-sensitive plant (oats) is investigated. The results of such expts. with 50 soils and the conclusions to be drawn from them are tabulated. F. M. SCHERTZ

Soil acidity. GEHRING. *Landw. Vers. Sta.* **104,** 164–77(1925).—Many clay and heavy loam soils which give increased yields of crops on liming show little or no "exchange" acidity. With these soils there is a parallelism between the response to liming and the degree of satn. for Ca, *i. e.*, the relation between the percentage of exchangeable Ca and the total percentage of Ca which the soil will absorb. When the exchangeable Ca is 70% or more of the total which the soil will take up, no response from liming is to be expected The application of these results to soils of other types is discussed. F. M. SCHERTZ

Rhodesian soils and their treatment. E. V. FLACK. *Rhodesia Agr. J.* **23,** 591–5 (1926). —Approx. 50% of Rhodesian soils are of granite origin. Bright tobacco and peanuts are the most satisfactory crops on these soils. The Great Dyke formation contains much Mg, and grass does best upon it. Most Rhodesian soils are well supplied with N and K_2O, deficient in P_2O_5 and low in CaO, but do not respond to applications of CaO. A. L. MEHRING

The effect of some soil conditions on nodule formation of Crotalaria juncea (L.). N GANGULEE. *Ann. Appl. Biol* **13,** 244–55(1926).—Nodule formation in *C. juncea* is affected by variations in temp., moisture content and soil reaction. It was increased by higher moisture content, increased coarseness of the soil, and by reduced H-ion concn C. H. R.

Studies on carbon dioxide production in soil and solution. D. V. BAL. *Ann. Appl Biol.* **13,** 231–43(1926) —*B. prodigiosus* can decompose glucose and fructose most readily with sucrose next in order. Lactose and maltose are only slightly decompd. The quantity of CO_2 produced is not equiv. to the quantity of sugar used up; other products, EtOH, Me_2CO and org. acids, are formed. CO_2 production attains its max. in 3–4 days and then declines rapidly in spite of the presence of sugar and active organisms Successive addns. of sugar to cultures, when CO_2 production has reached a min., increase CO_2 production again to a normal value. Exhaustion of total available C, the formation of a film on the particles of org. matter, or the exhaustion of available mineral constituents are not responsible for the lowering of CO_2 production in the soil. Addns. of org. matter (glucose, oil cake) to soil, after CO_2 production has declined, restores the process to its initial level. C. H. R.

The effect of progressive doses of Chile saltpeter on the sugar beet. JAROSLAV SOUČEK. *Z. Zuckerind. cechoslov. Rep.* **50,** 419–22, 499–503, 507–14(1926); *Listy Cukrov.* **44,** 129ff(1925–6); cf. *C. A.* **18,** 3096.—The results, for 1924, of plots with no $NaNO_3$ (*a*), plots with 100 kg. $NaNO_3$ per hectare (*b*), 200 kg. (*c*), 300 kg. (*d*), and 450 kg. (*e*), were: wt. of roots in hundreds of kg. per hectare, (*a*) 329, (*b*) 354, (*c*) 370, (*d*) 384, (*e*) 398; wt. tops (same units), (*a*) 169, (*b*) 186, (*c*) 202, (*d*) 216, (*e*) 234; ratio tops to roots, %, (*a*) 51.5, (*b*) 52.6, (*c*) 54.7, (*d*) 56.2, (*e*) 58.9; % sugar, (*a*) 19.18, (*b*) 19.31, (*c*) 19.33, (*d*) 19.35, (*e*) 19.18; purity, (*a*) 89.8, (*b*) 90.2, (*c*) 90.1, (*d*) 90.2, (*e*) 90.0; % N in beets, (*a*) 0.141, (*b*) 0.140, (*c*) 0.144, (*d*) 0.148, (*e*) 0.156. The results were more favorable than in the previous year, as $NaNO_3$ lengthens the vegetation period, and the growing season for the above tests was longer, giving riper beets. The diminishing returns from the higher dosages are quite marked. The expts. could be classified into five groups. The % in 1923 (*a*) and 1924 (*b*) were: *A* expts. in which $NaNO_3$ caused a lower sugar content, (*a*) 35, (*b*) 8; *B* expts. in which one fertilized plot showed higher sugar than the control, (*a*) 25, (*b*) 10; *C* two plots higher than

the control, (*a*) 9, (*b*) 22; *D* three plots higher than the control (*a*) 10, (*b*) 21; *E* all plots fertilized with $NaNO_3$ higher in sugar content than the control, (*a*) 23, (*b*) 39. Groups *A* and *B* were soils of higher N content and group *E* was soil of lower N content. The results of $NaNO_3$ treatment were more marked in beets harvested later in the season on heavier soils, on soils lower in CaO, and on acid or neutral soils. W. L. BADGER

Effect of calcium carbonate, gypsum, and sodium carbonate on soils rendered acid with hydrochloric and sulfuric acids. F. MUNTER. *Landw. Vers. Sta.* **104,** 177–82 (1925); cf. following abstrs. F. M. SCHERTZ

Vegetation and field experiments on soils showing "exchange" acidity. RÖSSLER. *Landw. Vers Sta* **104** 182–202; cf preceding and following abstrs. F. M. SCHERTZ

Effect of plants on soil reaction and its importance in vegetation experiments. KRUGER. *Landw Vers Sta* **104,** 202–15; cf preceding abstrs.—Different aspects of soil acidity are discussed with particular reference to the bearing of "exchange" acidity on the varied effects obtained by liming different types of acid soils. F. M SCHERTZ

Process for calcining phosphate rock. G R FISHBURNE. *Am. Fertilizer* **62,** 21–5(1925). The process is reviewed for prepg calcined phosphate by heating phosphate rock with 5 to 15% of an alkali salt such as Na_2SO_4. The product obtained is light, porous and easily crushed and the P_2O_5 present is almost completely citrate sol. W. H ROSS

Decomposition of green and organic manures under tropical conditions. A W. R. JOACHIM *Trop Agr* (Ceylon) **66,** 308–12(1926).—Max nitrification was obtained with castor pomace and fish scrap about the 8th week, during the 10th week with peanut meal, fish guano and dried blood, and at the end of the 6th week with barnyard manure and 5 varieties of green manure After 6–8 weeks decompn denitrification proceeds faster than nitrification Approx 60% of the N in castor pomace and fish scrap, 40% in peanut meal and fish guano and 30% in dried blood were converted into nitrates in the soil Nitrification slowed up in soils contg less than 13.5% H_2O (⅔ satn) A L MEHRING

Absorption of fertilizers by Ceylon soils. A W. R JOACHIM *Trop Agr* (Ceylon) **66,** 303–8(1926) H_2O percolating through soil failed to leach out of it 20–53% of various sol fertilizers which had been mixed with it A 2-in rainfall in 2 hrs did not carry an appreciable amt of fertilizers mixed in the top 3 in of soil to a depth of 6 in Nitrates, chlorides, sulfates and phosphates, were absorbed in increasing amts. in the order named A L. MEHRING

Modern double-superphosphate manufacture. E W. LEWIS. *Fertilizer, Feeding-Stuffs and Farm Supplies J* **11,** 661–2(1926) —A description of the mfg. process with a brief discussion of the chem reactions occurring during the manuf. and storage of the product K. D. JACOB

Relative merits of mono-, di-, and tricalcium phosphates as soil fertilizers. G. INGHAM *J S African Chem Inst* 9, 10–5(1926) - The interaction of soil and fertilizer plays an important part in detg the solv or extractability of P_2O_5 by 1% citric acid In a series of soils treated with rock phosphate or with superphosphate the % total P_2O_5 extd varied from 80 to 11 for the rock phosphate and from 89 to 21 for the superphosphate A satd soln. of CO_2 dissolved varying quantities of P_2O_5 from different grades of phosphate rock Given abundant rainfall and a fair amt of org matter in the soil, the softer varieties of rock phosphate may be expected to give results almost equal to those of superphosphates except in soils contg. $CaCO_3$ M S ANDERSON

Relative merits of mono-, di-, and tricalcic phosphates as soil fertilizers. S. KLING *J. S. African Chem. Inst* 9, 3–9(1926) - A discussion M. S ANDERSON

Rock phosphates versus superphosphates. T. D HALL *J. S African Chem. Inst.* 9, 16–20(1926) —The results are given of plot expts. with different fertilizer treatments M. S. ANDERSON

Equipment for excavating marl. H. H. MUSSELMAN. Michigan Agr. Expt. Sta., *Quart Bull.* 9, No 1, 17–21(1926). J. J. SKINNER

Effect of time of irrigation on production of crude protein in wheat. ALVIN KEZER. *Cereal Chemistry* 3, 340–2(1926).—During the last five years the Colorado Exp.

Sta. has attempted to discover if possible the most critical period in the demands for water in the development of the wheat crop. After considerable preliminary work, the growth periods selected for application of water were germination, tillering, jointing, heading, blossoming and filling. Experience of the first year showed that it was necessary to give a small irrigation at the time of planting in order to insure germination. The irrigations at tillering and jointing produce the highest protein content in the crop. While the production of protein is higher for irrigation at the earlier growth periods, the best quality of protein and the best quality of wheat are produced with irrigation at heading and blossoming time. If not more than one irrigation is possible an irrigation at the heading period is the most important in the production of quality and yield. The total protein produced is slightly lower but better grain and better quality of protein result. L. H. BAILEY

A review of scientific investigations on green manuring in India. A. W. R. JOACHIM. *Trop. Agr.* (Ceylon) **65,** 325–31(1925). A. L. MEHRING

Nutrient needs of greenhouse tomatoes. F. T. MCLEAN AND F. R. PEMBER. Rhode Island Agr. Expt. Sta., *Bull.* **205,** 16 pp. (1926).—Tomatoes grown in the greenhouse for 4 years from April to August on a silt loam soil were found to be sufficiently nourished by applications per month of 15 lbs. per acre of N, 6 lbs. of P_2O_5, and no K. The soil used was not deficient in K. The dry vines contained 2% N, 0.7% P_2O_5 and 1.8% K_2O, and the dry fruit 2.7% N, 1.0% P_2O_5 and 1.8% K_2O. J. J. SKINNER

Fumigation by hydrocyanic acid gas applied to the soil. C. H. BEAUMONT. *J. Dept. Agr. S. Australia* **29,** 954(1926).—Expts. with granular $Ca(CN)_2$ sprinkled in trenches in greenhouses give promise of very effective results against the eelworm. M. S. ANDERSON

Suspected poisoning of stock. M. H. KINGCOME AND A. W. FACER. *Rhodesia Agr. J.* **23,** 591–5(1926).—As, CN, strychnine and plant poisoning are discussed. A. L. MEHRING

Pyrethrum, its culture and application as a vermicide and an insecticide. M. STAEHELIN. *Heil- und Gewürz-Pflanzen* **9,** 39–45(1926).—A description of the cultural requirements of pyrethrum and manner of application (in soap soln.) for the eradication of many common garden and house pests, as caterpillars, aphids, fleas, etc., in general. W. O. E.

The discovery of the insecticidal property of carbon disulfide. PEREZ SIMMONS AND GEO. W. ELLINGTON. *Science* **64,** 326–7(1926). E. J. C.

Further experiments on the use of sulfur in relation to wart disease of potatoes. W. A. ROACH AND W. B. BRIERLEY. *Ann. Appl. Biol.* **13,** 301–7(1926).—Results of field tests are given. C. H. R.

Discussion on "The fungicidal action of sulfur." ANON. *Ann. Appl. Biol.* **13,** 308–18(1926).—The experiences of a number of investigators are given. C. H. R.

A quantitative examination of the toxicity of 3,5-dinitro-*o*-cresol and other compounds to insect eggs, under laboratory and field conditions. C. T. GIMINGHAM, A. M. MASSEE AND F. TATTERSFIELD. *Ann. Appl. Biol.* **13,** 446–65(1926).—3,5-Dinitro-*o*-cresol and its Na salt are toxic to eggs of *Selenia tetralunaria* (*C. A.* **20,** 2556) and other more resistant insect eggs, the Na salt being only slightly less toxic than the uncombined compd. Both were highly toxic to eggs of the aphid, *Phorodon humuli*, and had a general cleansing effect on plum trees. No injury to plum trees was observed. C. H. R.

Studies on contact insecticides. IV. A quantitative examination of the toxicity of certain plants and plant products to Aphis rumicis L. (the bean aphis). F. TATTERSFIELD, C. T. GIMINGHAM AND H. M. MORRIS. *Ann. Appl. Biol.* **13,** 424–45(1926); cf. *C. A.* **20,** 2556.—This is a study of the toxicity of certain plants to aphids. EtOH exts. of roots and stems of white haiari, stems of black haiari (species of *Lonchocarpus* from British Guiana), roots of *Tephrosia toxicaria* and leaves of *T. vogelii* possess notable insecticidal properties. When taken internally by caterpillars, the haiaris, *T. toxicaria* and *T. vogelii* have both a toxic and a repellent action. A toxic substance identical with tubatoxin (found in *Derris elliptica*) was isolated from the haiaris. A toxic resinous substance was isolated from *Tephrosia;* crystals closely resembling tephrosin (cf. Hanriot, *Compt. rend.* **144,** 150, 498, 651(1907)) were less toxic. Of a no. of other alkaloids tested, cytisine and lobeline were less toxic to aphids than nicotine, whereas eserine approached nicotine in toxicity. C. H. R.

Calcium cyanide for exterminating rats. V. J. KONINGSBERGER. *Arch. Suikerind.* **34,** 669–79(1926).—Rats in cane and rice fields can be killed easily by introducing 3 g. of granular $Ca(CN)_2$ into the rat hole, and plugging the exit with earth. This method is quick, simple, and cheap. It has no effect on cultivated plants, and the

residue left, $Ca(OH)_2$, is harmless. $Ca(CN)_2$ in dust form is not practical in Java, because the blower is too heavy for the coolie. A systematic campaign which would probably reduce the rats to a negligible no., is outlined. F. W. ZERBAN

Calcium cyanide and its utilization in the control of insect pests in Ceylon. W. H. BRITTAIN. *Trop. Agr.* (Ceylon) **67,** 45–9(1926). A. L. MEHRING

Sumatra derris root. ANON. *Fertilizer, Feeding-Stuffs and Farm Supplies J.* **11,** 663–4(1926).—The roots of the tuba plant (*Derris elliptica*) and particularly the root bark contain 2.5 to 3% of a resinous, poisonous principle known as derrid, which possesses valuable insecticidal properties. The sources, process of manuf. and use of this material as an insecticide are discussed. K. D. JACOB

Fumigation with hydrocyanic acid gas. Concentration and distribution as influenced by fumigation procedure. B. J. SMIT AND T. J. NAUDE. *Dept. Agr. Union S. Africa Sci. Bull.* No. **48,** 3–23(1926).—A comparison is made of the distribution of HCN produced in a fumigation chamber by the pot method and from liquid HCN. In the pot method the gas rises rapidly to the highest part of the chamber and descends along the sides of the chamber to the floor. In the course of this movement every part of the chamber sampled receives a wave of gas stronger than that of the theoretical concn. After about 10 min. the distribution is uniform all over the chamber. This rapid movement of gas is caused by the heat of the reaction between the hot H_2SO_4 and the NaCN, and by the steam rising from the generator. When, in fumigations with liquid HCN, the liquid is allowed to evap. without the heating or other aids to evapn., the nature and area of the surface on which the liquid is poured have an important effect on the spread of the gas. An unlimited smooth surface gives much more satisfactory results than a limited smooth surface. An unlimited porous surface (air-dry soil) gives inferior results. The results obtained by evapn. of the HCN by heat are practically the same as in the pot method. The results are graphically represented. RUSSELL M. JONES

Fertilizing rubber gardens in Java (ULTEE) **30.** Treating potassiferous silicates [for fertilizers] (Brit. pat. 242,336) **18.** Organic Hg compounds [as plant-protecting media] (Brit. pat. 243,361) **17.**

Fertilizer. F. W. FREISE. U. S. 1,601,954, Oct. 5. Crude nitrogenous material such as leather scrap is mixed with H_2SO_4 and phosphate rock and Ca cyanamide are added. Cf. *C. A.* **20,** 3532.

Alkali dicalcium phosphate. RHENANIA VEREIN CHEMISCHER FABRIKEN AKT.-GES. AND H. BRENEK. Brit. 242,512, March 20, 1925. A phosphate suitable for use as fertilizer is obtained by heating a mineral phosphate with "silicic acid in the form of silicates, sand or mineral phosphates rich in silicic acid" together with alkali salts such as carbonates or sulfates.

Insecticide and fungicide. C. DICKENS. Can. 263,491, Aug. 17, 1926. A soln. of Se in an aq. soln. of BaS is specified.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

The effect of manganese on alcoholic fermentation. N. ROSENBLATT AND A. J. MARCH. *Biochem. Z.* **170,** 344–54(1926).—The addn. of Mn salts to give concns. of Mn from 0.001 to 0.1% produces a gradually increasing inhibition of the alc. fermentation of sugar. The concn. of the sugar acts as a protection to the zymase: an increase in the sugar concn. necessitates an increase in Mn concn. to effect the same degree of inhibition, the increase of the latter being relatively much greater. On the other hand, in the presence of the same Mn-concn. the amt. of sugar fermented increases with the rise in the concn. of the substrate. S. MORGULIS

Proportion of spent hops in brewing. WIEGMANN. *Allgem. Brauer- u. Hopfenztg.* **1926,** No. 43; *Brasserie et malterie* **16,** 189–90(1926).—The spent hops are about 60% of the wt. of hops originally taken. The much larger residues (up to 98%) obtained when no hop extractor is used are due to a considerable proportion of ext. from the wort remaining in the spent hops. Dark beers give a slightly larger amt. of spent hops than pale beers. A. PAPINEAU-COUTURE

Brewing with and without hop extractor. WIEGMANN. *Z. ges. Brauw.*, March 20, **1926;** *Brasserie et malterie* **16,** 200–4(1926).—There is much less resin unaccounted

for when the extractor is used, and a greater proportion is retained in the beer when the extractor is used, so that the beer contains more resins though the amt. of hops used is only 90% of what is used without the extractor. Distribution of the resins in 2 brews of pale beer, with and without extractor, resp., was found to be as follows:

	Original Resins		In beer	Lost in fermentation	In breaks		In spent hops		Unaccounted for
	Soft	Hard			Soft	Hard	Soft	Hard	
Without	92.0	8.0	31.2	10.3	20.3	7.1	7.1	2.0	22.0
With	92.4	7.6	38.0	9.6	23.7	5.1	6.4	6.0	11.2

The bitter, so-called soft resin, are partially converted during brewing into hard resins.
A. Papineau-Couture

The function of nitrogen in the stability of beer. De Moor. *Petit j. brasseur* **34,** 85 93(1926); *Chimie et industrie* **16,** 120(1926).—From a discussion of the various factors involved in the increase or decrease of N compds. which can be assimilated by the yeast, de M. shows that the carbohydrate and nitrogenous contents of the wort should be balanced, that its acidity should be such as to give a beer with p_H 4.1–4.2, but that the latter should decrease with increase in the residual available N.
A. Papineau-Couture

Chemical equilibrium of monopotassium tartrate (cream of tartar) in aqueous and dilute alcoholic solutions with reference to the development of wines. Theodor Paul. *Arb. Reichsgesundh.* **57,** 94–111(1926); cf. *C. A.* **11,** 2708.—The soly., acidity (H-ion concn.), sp. elec. cond. and d were detd. for satd. aq. and dil. alc. solns. of $KHC_4H_4O_6$ at 0°, 5°, 10°, 14°, 18°, 20°, 25° and 30°. This work was undertaken as a contribution to the study of the reactions taking place by the sepn. of cream of tartar during the development of wines and for the detn. of the acidity of these. Satd. solns. were prepd. by dissolving pure $KHC_4H_4O_6$ in pure CO_2-free water and with 50, 80 and 100 g. German pharm. alc./l. The soly., which was detd. after P.'s method (*C. A.* 9, 1964; **10,** 2272), increases in both aq. and dil. alc. solns. with the temp., the increase being proportionally larger at the higher temps. The sp. cond., detd. after the method of Kohlrausch-Ostwald, and the soly. both decrease approx. proportionally with the alc. content. The d. was detd. to 5 decimals with a Sprengel-Ostwald pycnometer. The calcns. of the dissocn. equil prevailing in a soln. of $KHC_4H_4O_6$ are expressed in 7 equations, which permit the calcn. of the H-ion concn. as well as the other ion and mol. concns. The acidities (H-ion concns.) were also detd. experimentally by the sugar inversion method and were in agreement with the calcns. (cf. *C. A.* **11,** 2709; 18, 3133). From the detd. values of H^+ and K^+, the concns. of the other mols. and ions, *viz.*, $KHC_4H_4O_6$, $H_2C_4H_4O_6$, $HC_4H_4O_6^-$, $KC_4H_4O_6^-$ and $C_4H_4O_6^{--}$, were calcd. The equation for the calcn. of the sp. cond. is advanced in which detd. values for the migration velocity of the ions are inserted. With respect to the great no. of factors involved, the values calcd. from this agreed well with those obtained experimentally. The dissocn. consts. for $KHC_4H_4O_6$ in aq. soln. were calcd. from the concns. of the individual ions and mols. to $K_a = 1.4 \times 10^{-1}$ for the dissocn. into the ions K and $HC_4H_4O_6$ and to $K_h = 6.7 \times 10^{-5}$ for the ions H and $KC_4H_4O_6$, the first being about 2000 times greater than the latter. The soly product of $KHC_4H_4O_6$, expressed by $(K^+)(HC_4H_4O_6^-)$, was calcd. to $L_p = 4.6 \times 10^{-4}$ in aq. soln. at 20°. This value decreases with the addn. of alc. At 80 g. alc./l., which represents the av. alc. content of the German white wines, $L_p = 1.7 \times 10^{-4}$ was found.
D. Thuesen

Recent processes of wine treatment (sulfurization and clarification). Adolf Günther. *Arb. Reichsgesundh.* **57,** 112–21(1926).—Two recent processes are discussed for the cellar treatment of wine, permitted in Germany since 1923 (1) sulfurization with solns. of pure SO_2 in distd. water in a min. strength of 5%, or with $K_2S_2O_5$, and (2) clarification with c. p. $K_4Fe(CN)_6$.
C. N. Frey

Sugar-inverting bacteria and their industrial application (Mezzadroli) **11C.**

Fermentation of cellulosic materials. H. Langwell. U. S. 1,602,306, Oct. 5. In fermenting cellulosic materials such as rice straw or maize cobs or the production of AcOH, butyric acid and alc. by the action of organisms from manure, the H-ion concn. is maintained between 10^{-9} and 10^{-5}, measured in the bulk of the mash by the addn of compds. of NH_4 or of an alkali metal after the addn. of $CaCO_3$ or other compd. of a metal the phosphate of which is substantially insol. in H_2O.

Dehydrating alcohol. Distilleries des Deux-Sèvres. Brit. 243,368, Nov. 20, 1924. In dehydrating alc. by distn. in the presence of a liquid which yields an azeotropic

mixt. as described in Brit. 214,581 (*C. A.* **18,** 2783), the app is arranged to effect removal of impurities such as AcH, ether, acetone, Et formate or MeOH. If the impurity does not form a binary mixt. with the added liquid, it may be withdrawn directly from the top of a distg column

Autolysis of yeast and other microörganisms. M. KAHN, E. LEBRETON and G. SCHAEFFER Brit 243,373, Nov 19, 1924 In a process as described in Brit. 225,228 (*C. A.* **19,** 1606), 5 20% of NaCl is added to the material subjected to autolysis to prevent formation of alc and a temp of 40 55° may be maintained for a few hrs. before the addn of the NaCl, quickly to effect autolysis

Oriental styrax. O. ANSELMINO, R. SEITZ AND EMMA BODLÄNDER. *Arb. Reichsgesundh.* **57,** 162–72(1926).—A comparison of 15 samples of genuine styrax before and after the admixt. of adulterants with com. samples has demonstrated the value of the const. for the identification of styrax and the detection of adulterants. The following consts. were obtained: original styrax (Rhodos and Aidin): acid no (I) 45–61, sapon no. (II) 125–147, total cinnamic acid 14.6–19.0, free cinnamic acid 0.08–4.43, phenols 19.9–29.42, after dehydration by distn. with kerosene: I 64–80, II 178–195. After purification according to the German Pharm. V: I 56.4–65.3, II 163.1–168.2. The soly. in org. solvents was detd. by Sohxlet extn., evapn. and drying at 100°. When thus detd. the soly. in petroleum ether was 41–42%, but when an alc. soln. contg. large and varying quantities of water was shaken out with petroleum ether the soly. and the acid no. of the ext. increased with the water content up to 56.8% and 67.7, resp. On addn. of 30% colophony or turpentine the const. approached those of com. styrax very closely, showing an increase in I and a decrease in II and a remarkably low ratio of ester no. to acid no. Thirty % olive oil had the reverse effect. Most of the com. samples also leave a grease stain on paper, which is characteristic for the above admixts. A comparison with older analyses is difficult, since they refer to exts. and employ partly different and less satisfactory methods. MARY JACOBSEN

Further experiments on sputum disinfection. E. HAILER. *Arb. Reichsgesundh.* **57,** 703–15(1926); cf. *C. A.* **18,** 2733.—*B. tuberculosis* is completely killed by 4 hrs.' contact of 1 part sputum with 2 parts *alkalysol, parmetol, chloramine*, a 5% *Tb bacillol* soln. (a prepn. similar to alkalysol) and a 15% *chlorimide* soln. ($NCl(SO_3Na)_2$) contg. 7–8% active Cl. A 24-hr. contact permits considerable saving in disinfectant: 60–70% for alkalysol and Tb bacillol, 50% for chloramine, 60% for chlorimide. The undil., 15% chlorimide soln. is recommended for use in pocket expectorating cups, as it increases the sputum capacity from $^1/_3$ to $^1/_2$ of the total capacity. MARY JACOBSEN

Sterilization and standardization of opotherapeutic substances. BICE NEPPI. *Boll. chim. farm.* **65,** 449–56(1926).—Sterilization by heat, ultra-violet rays and chemicals may partly destroy the activity. Chemicals are not without danger to the patient, since, according to Pighini, minute doses of NaF, B_2O_3, SeO_3 and butyric and propionic acids affect the thyroid. Filtration through a candle is recommended. The filtrates are more active than the exts. deproteinized by acids or heat, more stable, perhaps owing to their high p_H (5.8–6.4) and have the original peroxidase content. The standardization should include the biol. assay, a detn. of ash and p_H, of I in thyroid, and a test for peroxidases, preservatives and org. foreign matter. MARY JACOBSEN

The soy bean as a source of important therapeutic and industrial products. ROMOLO VENTURI. *Boll. chim. farm.* **65,** 480–5(1926). MARY JACOBSEN

A new color reaction of mercuric salicylates and a few other substances. SILVIO GUGLIELMINETTI. *Giorn. farm. chim.* **75,** 169–73(1926).—Fractions of a mg. of mercuric (not mercurous) salicylates give with a drop of cold HNO_3 (d. 1.48) an intense violet, with ordinary concd. HNO_3-H_2SO_4 a reddish purple color which slowly turns blood red. Excess of Hg compd. and large samples must be avoided. The reaction is also positive with Hg *m*-hydroxybenzoate, and Hg methylsalicylate, negative with salicylic acid, its esters and salts, phenols and their substitution products, with other Hg compds. and naphthols. A soln. of 1 g. $Hg(NO_3)_2$ in 10 g. HNO_3 (d. 1.48) produces characteristic colors with the following compds.: Me salicylate, reddish violet; salol, intense violet; salacetol and salophen, like salol but less sensitive; anisic acid, faint violet; salicyaldehyde yellow, turning red and violet; salicin, yellow, rose, violet; β-naphthyl salicylate and aspirin, yellow. Most of the colors are destroyed by water and reducing agents, turn green with excess 10% NaOH, red with H_2SO_4 and are not altered by HNO_3 and HCl. MARY JACOBSEN

Contribution to the study of pharmaceutical preparations—lactic enzyme preparations. JACINTO PLACERES. *Rev. facultad cienc. quím.* **4,** 73–93(1926).—The following method for the detn. of activity of lactic enzyme prepns. (yoghurt and kefir) is superior to those generally applied (in France): One hundred cc. skimmed milk contg. 3% lactose, 50–70 g. glass beads and 1 cc. of the liquid or 0.5 g. of the solid prepn. are incubated 48 hrs. at 37°. The acid formed is titrated with NaOH and phenolphthalein. Most of the com. prepns., especially the solid ones, were inactive. Contamination by proteolytic enzymes was frequently encountered. The AcOH and HCO_2H production did not exceed the usual one. *Butyric acid* was found to be a decompn. product of fat. The sensitiveness of Berg's *lactic acid* test is 1:4000, that of Uffelmann's 1:2500. M. J.

Oil of fennel. B. N. RUTOVSKII AND L. G. TZYURIKH. *Trans. Sci. Chem. Pharm. Inst.* (Moscow) **1924,** No. 10, 69–70; *Chimie et industrie* **16,** 95(1926).—Extn. with Et_2O of fennel from Poltawa gave 7.41% of a mixt. of fixed and essential oils, which on steam

distn. gave 3.06% (presumably on the original fennel) of essential oil with d_{20} 0.9430, $[\alpha]_D$ 9.35°, n_D^{20} 1.5384, acid no. 0.94 A. PAPINEAU-COUTURE

Citrus oils. PEPPINO LIOTTA. *Profum. ital.* **3**, 340(1925); *Chimie et industrie* **16**, 95-6(1926).—Oils of known purity from the previous crops had: lemon d. 0.8643, $[\alpha]$ 60.5°, citral 4.5%; bergamot d. 0.882, $[\alpha]$ 14°, linalyl acetate 38%; mandarin d. 0.857, $[\alpha]$ 71°, methyl anthranilate 0.6%, Portugal d. 0.850, $[\alpha]$ 90.5°, aldehydes 1.3%; Seville orange neroli d. 0.8564, $[\alpha]$ 91.3°, aldehydes 0.9%; Seville orange petitgrain d. 0.9009, $[\alpha]$ 13°, esters 55.6%; lemon petitgrain d. 0.907, $[\alpha]$ 18°, citral 18-9%; mandarin petitgrain d. 0.890, $[\alpha]$ 11°, esters (as linalyl acetate) 53%; orange petitgrain d. 0.8854, $[\alpha]$ 37°, aldehydes 6.5%; neroli d. 0.8852, $[\alpha]$ 4.5°, esters (linalyl acetate) 4%; cedrate (*Citrus cedra*) d. 0.8692, $[\alpha]$ 60°, aldehydes 4%; lime (?) d. 0.8555, $[\alpha]$ 58°, aldehydes 12%. These values do not fall within the limits generally given for these various oils. A. PAPINEAU-COUTURE

Oil from the leaves and flowers of Dictamnus fraxinella Pers. B. N. RUTOVSKII AND I. V. VINOGRADOVA. *Trans. Sci. Chem. Pharm. Inst.* (Moscow) **1924**, No. 10, 71-5; *Chimie et industrie* **16**, 95(1926).—Steam distn. of flowers from plants grown in Crimea gave a 0.05% yield of oil with strong smell of anethole, and with d_4^{20} 0.9006, $[\alpha]_D$ 20.97° (in C_6H_6 soln.). The leaves gave a 0.15% yield of oil with the same odor and with d_D^{20} 0.9744, $[\alpha]_D$ +1.04°, acid no. 1.89, ester no. 34.15, Ac no. 43.33, sol. with slight turbidity in 3.7 vol. of 90% alc. and in 12 vol. of 80% alc., f. p. —2°. *Anethole* and *methylchavicol* were identified, and the former can be sepd. by cooling. Another sample obtained in 0.08% yield from a mixt. of leaves and flowers harvested toward the end of blossoming had d_{20} 0.9528, $[\alpha]_D$ + 3.57°, acid no. 1.72, ester no. 25.52, Ac no. 35.3 A. PAPINEAU-COUTURE

Seasonal variations in the cineole content of oil of eucalyptus. I. P. TIMOFEEV. *Trans. Sci. Chem. Pharm. Inst.* (Moscow) **1924**, No. 10, 99-100; *Chimie et industrie* **16**, 95(1926).—During 1919, on the 20th of each month 32 kg. of leaves were cut from 24 marked trees at Souchum (Caucasian district of the Black Sea), and distd., and the cineole content of the dried oil was detd. *via* Baker and Smith (the 165-85° fraction was considered as being cineole). The following results were obtained during the 12 months, starting with Jan.: 75.0, 74.7, 73.6, 69.7, 70.2, 46.2, 49.9, 57.0, 74.1, 57.1, 66.05, 65.0%. The min. occurs in June and the max. in Jan., probably on account of the temp. which facilitates the volatilization of the cineole. A. PAPINEAU-COUTURE

Some constants of oil of turmeric. B. N. RUTOVSKII AND P. P. LEONOV. *Troud. Naoutchn. Chim.-Farm. Inst.* **1924**, No. 10, 36-48; *Chimie et industrie* **16**, 95(1926).—*Oleum cinae* obtained in 1.03-1.42% yields, with loss of up to 9% of the santonin, had d_0^{25} 0.92111, $[\alpha]_D$ —3.19°, n_D^{25} 1.4650, acid no. 2.8, ester no. 12.1, cineole *via* Schimmel's resorcinol method 84.25%. Steam rectification caused a loss of 7.5% of cineole, and the rectified oil had d_4^{25} 0.9153, $[\alpha]_D$ - 2.64°, n_D 1.4627, acid no. 1.8, ester no. 12.3. The 0-85° fraction obtained on distn. contains a small amt. of *d*-pinene. A. PAPINEAU-COUTURE

Essential oil from the flowerheads of Perovskia atriplicifolia, Benth. M. G. RAO. *Quart. J. Indian Chem. Soc.* **3**, 141-7(1926).—A yield of 1% of oil on the wt. of dried flowerheads was obtained. It was light olive-green and had the following consts.: d_{30}^{30} 0.8943, n_D^{30} 1.4748; $[\alpha]_D^{30}$ 8.53°, acid value 0.2, ester value 30.4, ester value after acetylation 49.22. The oil is free from aldehydes and ketones and consists of about 50% of terpenes, among which *d*-α-pinene, β-pinene and camphene have been identified, 15-18% of alcs. and esters consisting mainly of *d*-borneol and bornyl acetate and the rest of sesquiterpenes consisting mainly of α-caryophyllene and aromadendrene. The combined acids consist almost entirely of AcOH. The oil may be of value as a source of *d*-borneol. Tables are given of the various fractionations and analyses made. R. C. ROBERTS

Determination of alkaloids in lupines. MACH. *Landw. Vers. Sta.* **104**, 226-31 (1925).—Sparteine is sepd. from lupinine by steam distn. and is detd. by pptn. with silicotungstic acid. The residue is mixed with gypsum, extd. with chloroform, treated with ether, and the ether soln. is shaken with 5% HCl, the acid liquid sepd. and the alkaloid finally pptd. with silicotungstic acid. F. M. SCHERTZ

Modern physico-chemistry and its pharmaceutical applications. W. A. WHATMOUGH. *Chemist & Druggist* **104**, 785, 854; **105**, 53, 168, 295, 364, 447, 539(1926); cf. *C. A.* **20**, 2389 S. WALDBOTT

A possible error in a test for subnitrate of bismuth prescribed in the German pharmacopeia. G. ROLLIN. *J. pharm. chim.* [8] **3**, 509-11(1926).—The $SnCl_2$ test

for *arsenic* may also indicate Te, but a certain sample free from As and Te gave a positive reaction, caused by traces of N_2O_5 present. Thus a sample after being heated in an elec. oven to 800°, and failing to react, gave a + result, rapidly, at 80° when 3 drops of HNO_3 were added to 0.8 g. of heated sample. This "false test" for As and Te is not produced if the N_2O_5 content of Bi_2O_3 is 10%, nor if the $SnCl_2$ reagent contains even a trace of $SnCl_4$. S. WALDBOTT

Pyrogenous oil of thuja. R. MASSY. *J. pharm. chim.* [8] **3,** 559–67(1926).—The differences existing between this oil, from the roots, stumps and trunks of the N. African *Callitris quadrivalvis* Ventenat, and that of Huerre (*C. A.* **20,** 2561), from the branches and leaves of *Thuja occidentalis* L., are tabulated. The N. African oil has d_{20} = 1.1 (Huerre, < 1), H_2O-sol. acidity 1–3.3 g. AcOH per 100 cc. (H., 0 6), and contains wood benzine b. below 150°, < 1% (H., 39%), tar oil b. 150–300°, 42–52%, contg. crude phenols, > 20%; residue of dry pitch, 40–50%; an oil volatile with steam, optical rotation > —20°. These tars resemble the Moroccan *arar* (*C. A.* **14,** 2983). Com. samples of thuja tar contained 1.20–4.50% of H_2O; 1 sample (through fraud, or faulty prepn.) 45.74%. S. WALDBOTT

Preparation of suspensions in oil of oxide and carbonate of bismuth for intramuscular injections. M. PICON. *J. pharm. chim.* [8] **4,** 5–11(1926); cf. Binet and Fleury, *C. A.* **20,** 1862.—Analysis of the contents of abscesses formed upon injection of olive-oil suspensions of hydrated Bi_2O_3 showed formation of a viscous, nonassimilable Bi soap. When $(BiO)_2CO_3$ is used (cf. P., *C. A.* **20,** 2227), no reaction with free fatty acid takes place. The use of lanolin mixed with the oil (French Codex) likewise seems harmful; olive oil alone suffices for suspensions. The dry Bi salt before being mixed with the oil should be bolted through a No. 200 silk cloth, and after mixing, strained through similar cloth. When $(BiO)_2CO_3$ is used, sterilization may be effected at 120°. S. WALDBOTT

Variations in the concentrations of pure commercial sulfuric acids, and necessity of using acid of density 1.84 in the sulfuric acid test of vaselines. F. RICHARD. *J. pharm. chim.* [8] **4,** 11–3(1926).—With 10 bottles of pure, com. H_2SO_4 from the same general lot, the sp. gr. varied from 1.817 to 1.843, corresponding to 89.56% (d. = 1.82) and 95.23% H_2SO_4. This uncertainty affects the testing of vaseline for purity (*C. A* **18,** 1732). "Vaselines suitably purified produce no appreciable coloration within 1 hr. when placed in contact with H_2SO_4 (d. 1 84), testing 95% of H_2SO_4." S. W.

Presence of barium chloride in the official calcium chloride. Directions for the detection of this impurity. F. RICHARD. *J. pharm. chim.* [8] **4,** 49–53(1926).—The $CaSO_4$ test of the Codex for Ba in $CaCl_2$ does not differentiate between $BaSO_4$ and $SrSO_4$ By means of the $SrCrO_4$ test, 3 com. samples showed, resp., 0 3857 0.4529 and 1.5040 g. of $BaCl_2 \cdot 2H_2O$ per kg. of $CaCl_2 \cdot 6H_2O$. The Ba content probably originated from the limestone of the Paris region, used in the Solvay manuf. of Na_2CO_3. A recent sample was free from Ba, but contained a trace of sulfate, probably caused by removal of Ba with H_2SO_4. S. WALDBOTT

Micrographic detection of tartaric acid in official preparations containing it. M FRANÇOIS AND C. LORMAND. *J. pharm. chim.* [8] **4,** 54–61(1926); cf. *C. A.* **18,** 703.—From any soln. contg. at least 0.150 g. tartaric (*A*) and less than 1 g. of citric acid per l., addn. of a concd. soln. of $Ca(AcO)_2$ (*C. A.* **19,** 1926) will ppt. characteristic crystals of $CaC_4H_4O_6$. Let stand for 3 days and apply to the ppt. (washed with 32% alc. and dried) Denigès color test (carmine-red on heating with H_2SO_4-resorcinol mixt. in boiling H_2O for 15 min.). To detect *A* in the *sirups and lemonades* of the Codex, they are first dild. with H_2O. In *sirup of* FeI_2, Fe is removed by pptn. with H_2S (NH_4SH and AcOH); excess of H_2S is destroyed by I followed by $Na_2S_2O_3$ In *wines, elixirs,* etc, sulfates are pptd. with $Pb(AcO)_2$ followed by Na_2CO_3. From *Seidlitz water,* $MgSO_4$ is removed by pptn. with $BaCl_2$ followed in the filtrate by Na_2CO_3. *Powder of* $HgCl_2$ *and A* is put into H_2O, its indigo is destroyed by adding HCl and NaClO; then Hg is pptd. with KI and several portions of Zn. Add slight excess of NH_4OH and filter. Sketches are shown of crystd. Ca tartrate, and Ca and Mg citrates. S. WALDBOTT

Polarimetric examination of oil of cade. R. MASSY. *J. pharm chim.* [8] **4,** 61–5 (1926).—The optical rotations of dephenolated, steam-distd. tars of roots, trunks and branches of *Juniperus oxycedrus* (*A*), *J. phoenicea* (*B*), *J. thurifera* (*C*) and *Pinus halepensis* (*D*) are detd. and tabulated. True oil of cade, from the *trunk* of *A*, is decidedly *l*-rotatory, confirming Huerre (*C. A.* **20,** 2561) and M. (*C. A.* **17,** 888). The oil from branches of *A* is optically little active, that from roots, giving only a small yield (3.06%), has + rotation. The oils of *B* and *C*, being *l*-rotatory, cannot be differentiated from true oil of cade by optical rotation. *D* yields a faintly + product;

but the tar of *Cedrus atlantica* is the only one of this series that may be identified by its decidedly + optical rotation. S. WALDBOTT

Assay of oil of cade. R. HUERRE. *J pharm. chim.* [8] **4,** 65-6(1926).—H. reaffirms the authenticity of 4 samples (*C. A.* **20,** 2561), which was doubted by Massy (cf. preceding abstr.) on account of the high values of their negative optical rotation. These oils gave the *l*-cadinene-2HCl test, thus far considered characteristic for true oil of cade. H. suggests that this test be applied by M to his *l*-rotatory oils from *B* and *C*. S. WALDBOTT

Cacodylate of strychnine. J. BOUILLOT. *J. pharm. chim.* [8] **4,** 145-56(1926).—This substance, introduced by Eysseric in 1902 as a remedy in tuberculosis, is not a chem. compd , but an approx. equimol. mixt. of its 2 components. B. was unable to effect their chem combination Com. samples showed excess of either cacodylic acid or strychnine (cf. Lemaire, *C A.* **5,** 2899); hence this prepn. should not be used in therapeutics S. WALDBOTT

Comparison of the results of assay of the different cinchona preparations. E. LEGER. *J. pharm chim* [8] **4,** 156 63, 193-201(1926) —In view of reported large losses in alkaloid in the making of galenical prepns of cinchona barks (cf. Barel, *C. A.* **20,** 1302), L detd the exact alkaloidal content by wt and by titration of powd. red and yellow barks, as well as of the galenicals prepd. from these by the Codex methods, slightly modified when required With both the red and the yellow barks, the wt. of crude alkaloids in 100 g of non-dried powder contg about 9% H_2O proved to be equal to the quantity of pure alkaloids detd. volumetrically (hematoxylin) from the same powder dried at 100° The non-dried powders of red and yellow barks contained, resp., 8.20 and 4.20% total alkaloids The various prepns from these barks had the following alkaloidal contents *Red bark* —Fluidext , Codex, 7% (loss 14 63%); fluidext. with resin, 7.40% (loss 9.75%); tincture, 1 061% (loss 35.12%); soft ext (yield 17 50%), 10.84% (loss 76 86%); (red) wine of cinchona, 0 1175% (loss 42.67%); white wine, 0 105% (loss 48 77%). *Yellow bark* —Dry ext (yield 23 60%), 13.76% (loss 29 39%); fluidext., 3 84% (loss 16 52%). The relatively small losses of alkaloid in the fluidexts , and the large loss in the soft ext of the red bark prepd. by extn with H_2O (the yellow bark with 60% alc), are notable. An increase in the Codex requirements for total alkaloids of the red bark to 5-7%, for those of fluidext. to 4-5%, and of soft ext. to 6-8% is recommended S. WALDBOTT

Emulsions and their preparations, a colloid-chemical study. E. ISELIN. *Pharm. Acta Helv.* **1,** 45 55, 81-8(1926) -On the basis of theoretical and practical considerations, a permanent and palatable 50% cod-liver oil emulsion is prepd. as follows: Melt in a beaker palmitic acid 1 5 g , stir in *N* KOH 8 0 while heating, add drop by drop mucilage of gum arabic 20 0, continue heat and agitation and add a soln. of gelatin 0.5 in 40.0 of H_2O A white, homogeneous soap magma results. Add drop by drop, while stirring, a mixt of cod liver oil 100 0, and oils of cinnamon and cloves, 4 drops each, previously heated in a 500 cc round-bottom flask by immersion in boiling H_2O. Finally add simple sirup 30 0 g contg tincture of orange peel 3.0 g. Put the yellowish white emulsion back into the bottle, immerse twice in boiling H_2O for a short time, always shaking well, finally put the flask into cold H_2O. A perfect emulsion is thus obtained. References to literature are given abundantly. S. WALDBOTT

Electrometric determination of the hydrolysis of caffeine citrate. C. MORTON. *Pharm. J.* **116,** 78-80(1926).—Caffeine citrate (*A*) in abs. EtOH soln. is a true compd. but is almost completely hydrolyzed in aq. soln , even if satd. The theory and the exptl. details and results of electrometric measurements are given, with line drawings of app. used, and the following conclusions are reached. (1) The electrometric method is suitable for the detn. of the basic strengths of alkaloids and the degree of hydrolysis of alkaloidal salts. It should prove of especial value for the stronger alkaloids, such as strychnine, in which the degree of hydrolysis of the HCl salt is slight. In such cases, since the H-ion concn. is minute, the polarimetric and colorimetric methods do not yield accurate results. However, complications may arise in alkaloids which are converted into dihydro derivs by molecular H in the presence of Pt black. (2) The dissocn. const. of caffeine is $K_b = 6.8 \times 10^{-13}$. The hydrolytic dissocn. of salts of caffeine with strong acids does not follow the simple diln. law, and a careful investi-

gation of the anomaly should yield interesting results. (3) The hydrolytic dissocn. of *A* is practically complete even in satd. soln. Since the salt in soln. is completely decomposed into free caffeine and acid, *A* should offer no advantage over the alkaloid itself for pharmaceutical use, while the citric acid formed by hydrolysis is a frequent cause of incompatibility in dispensing. Hence, as pointed out by Squire, the use of *A* in pharmacy is to be condemned. S. WALDBOTT

Determination of the basic constant of morphine and its application in the titration of morphine. C. MORTON. *Pharm. J.* **116**, 567–70, 593–7(1926); cf. preceding abstract.—A formula for the basic const. of morphine is developed, and the electrometric method of the detn. of the H-ion concn. of morphine-HCl solns. is described in detail, with line drawings of app. used. The theory of indicators is applied to the titration of morphine. On theoretical grounds, the accepted methods of titrating morphine cannot be expected to yield accurate results, and this conclusion is fully borne out by expt. The error in direct titration is greatest when litmus and cochineal are used as indicators, less with Me orange, and least with bromophenol blue (cf. Evers, *C. A.* **15**, 3893). Under suitable conditions, however, each of these indicators may be made to yield satisfactory results. The basic const. of morphine at 30° is K_b = 6.27×10^{-9}. Unlike the weaker alkaloids, such as caffeine, the hydrolysis of the HCl salt in aq. soln. varies in strict accordance with the law of mass action. S. W.

The Pharmacological Laboratories. ANON. *Pharm. J.* **116**, 205–6(1926).—This institution, under the auspices of the Pharmaceutical Society of Gt. Britain, is a central testing station for the physiol. examn. of (1) aq. ext. of the posterior lobe of the pituitary gland, (2) digitalis, strophanthus and squill and (3) ergot, according to the international standard methods (Geneva Conference, 1925). **Opening of the Pharmacological Laboratories, June 16, 1926.** *Ibid* **116**, 642–6.—An account of the proceedings; with photographs, including those of biol. testing app. Also in *Chemist & Druggist* **104**, 829–32(1926). S. WALDBOTT

Note on thyroid extract and potassium permanganate. J. J. BLACKIE. *Pharm. J.* **116**, 229–31, DRYERRE. *Ibid* 240–1; *Chemist & Druggist* **104**, 306–7(1926).—A discussion on the best mode of dispensing this possibly incompatible mixt. recommended by Nott (*C. A.* **19**, 3113; **20**, 1272). The mixt. is permanent when kept in a dry bottle, but in presence of H_2O, a reaction takes place at once, although no I is set free. In discussion, D. questioned the clinical necessity of the use of $KMnO_4$, also, whether the physiol. action of thyroxin fully explained the function of the thyroid gland. S. WALDBOTT

The British pharmacopeia: Criticisms and suggestions for future editions. F. G. HOBART. *Pharm. J.* **116**, 328–30(1926).—Many brief comments are made; certain new tests are recommended, *e. g.*, for free Cl (with KBr and $CHCl_3$) in Liq. ferri perchlor., owing to new modes of manuf. S. WALDBOTT

Ointments. IVY ROBERTS. *Pharm. J.* **116**, 336(1926).—Abstract of a lecture on difficulties in the prepn. of ointments, and modes of overcoming them. S. W.

The Pharmaceutical Institute of the University of Basel. H. G. GREENISH. *Pharm. J.* **116**, 598–602(1926).—A descriptive account, illustrated. S. WALDBOTT

Determination of morphine in poppy extracts. C. T. BENNETT AND D. C. GARRATT. *Pharm. J.* **117**, 149, 208; *Chemist & Druggist* **105**, 235(1926).—The morphine content of poppy capsules varies from 0.16 to 0.28%. The Brit. Pharm. method for the assay of opium cannot be applied to poppy exts., as direct treatment with lime yields an unwieldy magma. A method is given by which the ext. is first exhausted with Me_2COH, the solvent distd. off, the residue treated with milk of lime, and after filtering, an aliquot part is treated similarly to the Brit. Pharm. assay method for morphine. The results by this method agree well with those obtained by the method of Tickle (*C. A.* **1**, 1455) and, for opium and its tincture, with those obtained by the Brit. Pharm. process. The standard suggested for the liquid extract of poppy is 0.20 g. morphine per 100 cc. S. WALDBOTT

A reaction between lead subacetate and phenol. G. A. MEDLEY. *Pharm. J.* **117**, 149–50, 209; *Chemist & Druggist* **105**, 256(1926).—An 8% aq. soln. of PhOH gave with $PbO.Pb(AcO)_2$ (not with $Pb(AcO)_2$) a white ppt., probably $(PhO)_2Pb$, sol. in 50% alc., acetone, C_6H_6, $CHCl_3$ and Et_2O, also in dil. AcOH. Many other phenols gave similar ppts., all (except with pyrogallol) sol. in AcOH. Phenols with more than 1 free OH group yielded ppts. insol. in $CHCl_3$. In dispensing, pptn. is best prevented by adding a few drops of dild. AcOH. S. WALDBOTT

Use of carbon tetrachloride in pharmacy. G. E. TREASE AND H. TINGEY. *Pharm. J.* **117**, 150–2, 210; *Chemist & Druggist* **105**, 257–8(1926).—CCl_4 may be used for the prepn. of certain oleoresins, but its only advantage over the solvents now in use seems

to be its non-inflammability. It is inferior to other solvents for alkaloids except in case of cocaine (soly. 31.94: 100 g. at 20°). The soly. of I in CCl_4 increases rapidly with temp. (34.22 g. per l. at 30°, 130.10 g. at 77°). Like $CHCl_3$ and CHI_3, CCl_4 gives characteristic colors with *o*- and *m*-phenol derivs., but unlike these, not with *p*-cresol, eugenol and β-naphthol. The colors produced in the case of CCl_4 are probably due to dyes of the aurin type. S. WALDBOTT

The new German pharmacopeia, 6th ed. ANON. *Pharm. J.* **117**, 415–8(1926).—A detailed review; "the qual. and quant. chem. tests have all been arranged with the express purpose of saving time and material." S. WALDBOTT

Insect powder. L. REUTTER. *Schweiz. Apoth. Ztg.* **64**, 341–4(1926).—A review of the isolation and the chem. and phys. properties of the active principles of insect powder. S. WALDBOTT

The new German Pharmacopeia. L. ROSENTHALER. *Schweiz. Apoth. Ztg.* **64**, 457–61(1926).—A detailed review of the new features of the 6th edition. S. W.

Silver protein preparations. ANON. *J. Am. Med. Assoc.* **87**, 430(1926).—The U. S. P. X classifies the Ag prepns. and provides standards. The Chem. Lab. Am. Med. Assoc. examd. all of the Ag prepns. described in the N. N. R. to ascertain whether they complied with the standards of the U. S. P. X. The chief U. S. P. criteria for the control and purity of these prepns. are Ag content and yeast fermentation inhibition (cf. Peterson, *C. A.* 20, 3332). The prepns. examd. and their detd. Ag content were proganol 8.7%; protargentum 8.6; protargol 8.4; argyn 26.3; argyrol 19.4; cargentos 20.2; silvol 19.9; solargentum 19.5 and vargol 21.8%. All of the prepns. passed the yeast test except cargentos, which was slightly stronger than the standard, and vargol, which was 8 times too strong. The latter product was withdrawn by the maker and another that was promised to conform to the U. S. P. standard was placed on the market. L. E. WARREN

The microtitration of iodides with iodate and the determination of the iodide and ferrous iron content in syrup of ferrous iodide. I. M. KOLTHOFF. *J. Am. Pharm. Assoc.* **15**, 164–6(1926).—To 10 cc. of a 0.1 *M* soln. of KI are added 80 cc. of H_2O, 20 cc. of 25% HCl and 4–5 cc. of 10% KCN. The titration is then completed by $^1/_{60}$ *M* (or weaker) KIO_3 soln., with CCl_4 or $CHCl_3$ as indicator. The results are accurate even in the presence of large quantities of RBr. The method is accurate to 1% in solns. contg. 0.127 mg. of I in 100 cc. In mixts. contg. other substances oxidized by RIO_3 the method is reversed, the I being oxidized to RIO_3 by hypochlorous acid and the I titrated with KI. By this method the accuracy was 1% on 0.1 mg. in 100 cc. The method is not applicable for the assay of syrup of FeI_2. For this assay 10 cc. of the liquid are dild. with 80 cc. of H_2O, 10 cc. of 25% H_3PO_4 and 5 cc. of 10% KCN. Then 0.1 *N* $KMnO_4$ is run in until the liquid is colored faintly pink. Then an excess of KI is added and the liberated I titrated with $Na_2S_2O_3$. Both the I content and the FeI_2 may be calcd. L. E. WARREN

The stability of official pepsin preparations. H. W. VAHLTEICH. *J. Am. Pharm. Assoc.* **15**, 193–6(1926).—Various pepsin prepns. were made up from the same lot of granular pepsin with varying quantities of HCl and purine derivs. and their stabilities were studied. A portion of the original pepsin was kept and was assayed each time that the prepns. were. This suffered no loss in 2 yrs. Caffeine, theobromine, theobromine-Na salicylate and uric acid were the purines used. Glycerite of pepsin N. F. IV keeps very well while elixir of pepsin lost its entire activity. The presence of purines does not enhance the keeping properties much. The p_H of the elixirs of pepsin is close to the optimum for enzyme activity. This suggests that the enzyme may digest itself or its carrier. L. E. WARREN

The volatile oil of Ledum groenlandicum. E. V. LYNN, ARNOLD LEHMAN AND RUSSELL CAIN. *J. Am. Pharm. Assoc.* **15**, 263–5(1926).—*Ledum groenlandicum*, or Labrador-tea, gives 0.013% of a volatile oil on distn. with steam. Very little oil is found in the stems. The plant relatively free from stems gave 0.035% of oil, $d_{21.2}$ 0.8998, n_D 1.4917. The oil was fractionated between 166° and 310° and the several fractions were examd. in as much detail as the limited quantity permitted. There is very little ledum camphor or other stearoptene present. Limited amts. of phenols and aldehydes as well as sesquiterpenes and azulene are present. L. E. WARREN

Extracts of aconitum columbianum. O. A. BEATH. *J. Am. Pharm. Assoc.* **15**, 265–6(1926).—Specimens were collected in 2 periods of growth, *i. e.*, in the pre-flowering stage and in the full-flowering state. The specimens were assayed for alkaloids by the U. S. P. IX method for aconite. The results were: tubers (flowering) 0.839; tubers

(young plants) 0.774; above-ground (flowering) 0.350; above-ground (young plants) 0.758. Fluidexts. were prepd. from the several portions of the drug and the toxicity of each was detd. by the biol. method. All were relatively non-toxic. L. E. WARREN

The determination of the amount of oil in spirit of peppermint. C. V. NETZ. *J. Am. Pharm. Assoc.* **15**, 278–9(1926).—LaWall's and Forman's method (*C. A.* **8**, 784) was tested on known samples made without herb. The method gave results within 0.1% of the truth. Samples made strictly according to the U. S. P. gave but 9.8% of oil or 98% of the truth. N. concludes that some oil is lost in the herb and on the filter in the U. S. P. mfg. process. Since the U. S. P. does provide for an assay of the spirit, a specimen assaying 98% of the theoretical amt. of oil is U. S. P. in strength. Of 33 market specimens assayed by N. 4 or 5 were of good quality. L. E. WARREN

The melting point of sodium phosphate U. S. P. H. F. HILDEBRANDT, R. E. SCHOETZOW AND P. M. GIESY. *J. Am. Pharm. Assoc.* **15**, 432–3(1926).—Na phosphate U. S. P. is the dodecahydrate. The U. S. P. states that when heated to about 40° the salt fuses, yielding a colorless liquid. The authors show that this statement is without significance. The dodecahydrate is not stable above 36°. At this temp. it changes to a mixt. of heptahydrate and H_2O. The H_2O dissolves most of the heptahydrate, a liquid being formed. On cooling the heptahydrate crystallizes. This combines with the balance of the H_2O, forming a solid cake. The pharmaceutical remedy is to market the heptahydrate $Na_2HPO_4.7H_2O$ which is stable up to 48°. L. E. WARREN

Diethyl phthalate. IV. J. A. HANDY AND L. F. HOYT. *J. Am. Pharm. Assoc.* **15**, 454–61(1926). Continuation (*C. A.* **17**, 853; **19**, 152, 3001.)—Heating the mixt. to 150° for 3 min. for the formation of fluorescein was most satisfactory. The EtOH soln. of KOH must be free from aldehydes. To 0.1 cc. (usually 5 small drops) of sample in a small beaker, add 1 cc. of EtOH-KOH. Heat on a steam bath until the EtOH is completely removed. From a graduated pipet add 0.5 cc. resorcinol-H_2SO_4 reagent, rotating the container so that the acid thoroughly wets the entire residue and heat for 3 min. in an oil bath at a temp. not over 150°. Cool and pour the reaction mixt. into 40 cc. of distd. H_2O in a small flask. Make alk. with 10 cc. of 10% NaOH soln. A yellowish green fluorescence persistent for 24 hrs. and longer is proof of the presence of diethyl phthalate or some other phthalate in the sample. The test was applied to 25 perfume substances, 7 of which responded to the test. Samples which contd. the diethyl phthalate were seen to give a ppt. of K phthalate in needle-like crystals a few min. after the material had been placed on the steam bath. Under the conditions the cryst. test is given when 0.005 g. of diethyl phthalate is present, and in some volatile oils when only 0.002 g. are present. The test (*A*) is given: To 1 cc. of perfume in a small beaker add 1 cc. EtOH-KOH. Evap. slowly with gentle heat and observe frequently, holding the beaker in front of a light. Provided the 1 cc. sample used contains 5 mg. or over of diethyl phthalate (*i. e.*, 0.5% and in many cases if only 2 mg. are present) the characteristic silky, needle-like crystals of K phthalate will be seen to form in the soln. If no characteristic crystals form, it is proof that some EtOH other than 39B or 39C has been used in the manuf. of the perfume. If no crystals form by test *A*, repeat, using 10 cc. of sample and 1 cc. of EtOH-KOH. Evap. and observe as in test *A*. If the sample contains 5 mg. or more of diethyl phthalate (*i. e.*, 0.05%), crystals of K phthalate form. This method is simple, rapid and sensitive. It is applicable directly to essential oils, perfumes, denatured alcs. and other H_2O-free liquids and may be applied to the petroleum ether ext. products such as toilet water and beverages. Results of its application to a great no. of essential oils, perfume ingredients and perfumes show that it will detect with certainty 5 mg. (and often as small an amt. as 2 mg.) of diethyl phthalate in a 0.1 cc. portion of essential oil or in a 10 cc. portion of perfume. L. E. WARREN

A note on the assay of solution of arsenious and mercuric iodide. WILMER H. SCHULZE. *J. Am. Pharm. Assoc.* **15**, 464–5(1926).—The AsI_3 content of a solution of arsenious and mercuric iodide undergoes a rapid change on keeping. This change appears to be much accelerated by exposure to light. The present U. S. P. method for detg. the AsI_3 content is unreliable and should be changed to a detn. of the total As present. L. E. WARREN

Ephedrine and pseudoephedrine, their isolation, constitution, isomerism, properties, derivatives and synthesis. K. K. CHEN AND C. H. KAO. *J. Am. Pharm. Assoc.* **15**, 625–39(1926).—Ephedrine and pseudoephedrine are isomeric alkaloids obtained from *Ephedra vulgaris* var. *helvetica*. From the literature it seems probable that the levo variety is found in the plant when grown in China and pseudoephedrine in the European plant. The base is oily but crystallizes on standing; m. 39–40°; the HCl salt m. 214–6° and is optically active; α_D 34.96. The Pt salt m. 184–6°; Ag salt golden

crystals m. 128–31°; HI salt m. 155–6°; the sulfate m. 235–6°. Many other salts and esters were prepd. and their properties described. Ephedrine had been synthesized previously. L. E. WARREN

Analysis of emulsions of cod-liver oil and malt extract. C. S. WAGGONER AND C. C. GLOVER. *J. Am Pharm. Assoc* **15**, 754–5(1926).—Methods for the analysis of C. L. O emulsions are unreliable because the oil gains in wt on heating; also the most suitable solvent had not been ascertained. Expts indicated that the oil would gain about 10% of its wt on heating The solvents tried were Et_2O, petr benzine (30–60°), CS_2, $CHCl_3$ and EtOAc Et_2O and petr benzine were the most satisfactory solvents tried and EtOH was best for breaking the emulsions. Add 15 cc of H_2O to 4–6 g of the emulsion and stir Add 50 cc of EtOH and shake until the emulsion breaks; then add 50 cc of petr benzine and shake. Repeat the shaking out process 4 or 5 times. Evap the solvent and dry the residue over H_2SO_4 The method was applied to known and com samples The results on the known samples were a little low; *e. g.*, on a 20% emulsion (by wt) a correction of 0 5% brings the value about true Com. emulsions of cod-liver oil and malt contain about 20% of oil L. E. WARREN

A note on the ephedrine content of ephedra vulgaris var. helvetica. PETER MASUCCI AND KO SUTO *J Am Pharm. Assoc* **15**, 758(1926) —The ephedrine content of this drug has been reported by Chen (*C A* **19**, 2863) as from 0 018 to 0 091% A specimen of the identified drug gave 0 305 and 0 298% by 2 different analysts Three fluidexts were made from the drug These assayed 0.312, 0 462 and 0 306 g of alkaloid per 100 cc L. E. WARREN

Stability of hexylresorcinol in pharmaceutical preparation. WM A. FEIRER AND VEADER LEONARD *J. Pharmacol* **28**, 395–7(1926) —Hexylresorcinol, in soln in olive oil enclosed in sol gelatin capsules, does not deteriorate on standing for 1 year at room temp C J WEST

German ethereal flower extract oils. W. TREFF, F. RITTER AND H WITTRISCH. *J prakt Chem* **113**, 355 60(1926); cf. v. Soden, *C A* **19**, 3147 —Violet leaves (*Viola rossica* var. "*Konigin Charlotte*") gave 0 0166% of ethereal oil, d_{15} 0 912, acid no. 52, ester no 76 1, Ac no. 172, optically inactive. The garden nettle, *Dianthus caryophyllus* L, gave 0.0498% oil, d_{15} 1 010, $[\alpha]_{D100}$ – 0°36′, acid no. 28, ester no 132, Ac no. 249 The flowers of the jasmine (mixt. of several varieties) gave 0 06% oil, d_{15} 0 947, $[\alpha]_{D100}$ 0°, acid no 28, ester no 73, Ac no 224 The yellow lupine flowers (*Lupinus luteus* L) gave 0 0195% oil, d_{15} 0 900, $[\alpha]_{D100}$ 7°30′, acid no. 38, ester no 31, Ac no 143 Broom flowers (*Genista tinctoria* L) gave 0 0364% oil, with d_{15} 0 9335, $[\alpha]_{D100}$ - 9°10′, acid no. 18, ester no. 35, Ac no. 156. C. J. WEST

Butternut oil [as therapeutic agent] (U. S. pat. 1,602,004) **27.** Drying tobacco (U. S. pat. 1,567,031) **13.**

1-Methoxymethyl-3,7-dimethylxanthine. FARBENFABRIKEN VORM. F. BAYER & CO. Brit 242,296, Oct 29, 1924 Theobromine or its salts is treated with chloromethylether. Its physiol action resembles that of caffeine and it forms double compds with salts of org acids such as Na benzoate and Na salicylate.

Cholesterol esters. SOC ANON POUR L'IND. CHIM. À BÂLE. Brit. 243,510, Nov. 7, 1924. Therapeutic esters are prepd from cholesterol and phenylpropiolic, crotonic, tetrolic, or α-benzylidenepropionic acid or similar acids Their therapeutic activity is increased by using them in soln with phenylacetylene and camphor.

Anthelmintic. FARBENFABRIKEN VORM. F. BAYER & CO. Brit. 243,325, Nov. 21, 1924. Latex either coagulated or uncoagulated, of *Ficus glabrata* or *Ficus doliaria*, is extd. with petroleum ether or other suitable org. solvent so as to leave an active anthelmintic substance as a residue

Medicated pastiles. KNOLL & CO. Brit. 242,323, July 4, 1924. Camphor, santal oil, ethereal oils, alkaloids and brominated or iodized fats or other medicines insol in aq mixts. of glycerol and gelatin are dissolved in anhyd. mixts of glycerol and gelatin to form pastiles which may be rendered tasteless with a layer of non-medicated gelatin and may be treated with CH_2O to prevent digestion until they reach the intestine.

Mercury thiocyanogen compound. O. NEUBERT, K. SCHRANZ and G. WESENBERG. U. S 1,602,777, Oct. 12. A sol. colloidal Hg thiocyanogen compd. which may be used in ointments is prepd. by treating solns. of Hg salts, *e. g.*, Hg acetate, with solns. of thiocyanates such as KCNS in the presence of albumose or other protective colloid.

Organic mercury compounds. FARBENFABRIKEN VORM. F. BAYER & Co. Brit. 243,361, Nov. 21, 1924. The Hg compd. of *o*-nitrophenol is dissolved in dil. NaOH soln , mixed with an aq. soln. of albumose, neutralized with dil. HOAc and pptd. with acetone. An aq. Hg acetate soln. is treated with dextrin and PhOH and pptd. with concd. alc. Mercurized *o*-chlorophenol may be similarly treated. Products thus prepd. are used in medicine and as *plant-protecting media, e. g.*, for immunizing grain

Picrates of local anesthetics. F. K. THAYER. U. S. 1,596,259, Aug. 17. Antiseptic anesthetic compns. suitable for treating burns and other skin lesions are prepd. by reaction of picric acid with 3 mol. proportions of a local anesthetic in a solvent such as H_2O, alc or C_6H_6. The picric acid salt of *n*-butyl-*p*-aminobenzoate m. 109-10°; the picric acid salt of ethyl-*p*-aminobenzoate m 120-1°; the picric acid salt of methyl-*m*-amino-*p*-hydroxybenzoic acid m 221-2° (decompn); the picric acid salt of diethylaminoethyl-*p*-aminobenzoate (procaine picrate) m 133–4°; the picric acid salt of di-*n*-butylaminopropyl-*p*-aminobenzoate m. 85–8°. These compds. are well dild with unguents for local use

Toxin and antitoxin of scarlet fever. G. F. DICK and G. H. DICK. Brit. 243,675, Nov. 28, 1924.

Tamponing wounds. R. VOGEL. U. S. 1,593,814, July 27. Blood is mixed with Na citrate or other non-poisonous material which delays coagulation to such an extent that the blood is approx in a state of unstable equil with regard to its coagulating quality, a substance such as $CaCl_2$ is subsequently added to cause the blood to coagulate rapidly and prior to its coagulation, the blood is applied to a wound.

18—ACIDS, ALKALIES, SALTS AND SUNDRIES

FRED C. ZEISBERG

Mechanism of the formation of sulfuric acid in the lead-chamber process. ANDRÉ GRAIRE. *Chimie et industrie* **16**, 3 15, 181 9(1926); cf. *C. A.* **18**, 3454; **19**, 1231, 1675, 3148.—A discussion of the improbability of the formation of so-called intermediate compds , of the nature of the oxidation reactions of SO_2, and of the effects of the concn. of SO_2, N oxides, O_2 and H_2O in the gases, of the nature of the nitrous gases, of temp , of the rate of flow of the gases, and of the elimination of H_2SO_4 from the reaction by pptn. Bibliography of 24 references. A. PAPINEAU-COUTURE

The absorption of gaseous hydrogen chloride by sulfuric acid. VÁCLAV ČUPR. *Spisy Vydávané Přírodovědeckou Fakultou Masarykovy Univ* **1925**, No. 63, 3–17.—The soly. of HCl in 77-100% H_2SO_4 solns. was measured at 25°, with a special app. There was a min of 92 mg. HCl per 100 g H_2SO_4 soln. at 89% H_2SO_4, the soly. at 76% being 350 mg. and at 100%, 400 mg. Measurements were also made between 9 and 83% H_2SO_4 at 0°, 21 and 72% at —15.8° and 33 and 69% at —25°. The results are con ordant among themselves and with those of Coppadoro (cf. *C. A.* **5**, 1022). F. C. Z.

[illegible]e absorption of hydrogen chloride and sulfur dioxide [illegible] acid [illegible]

[illegible] and 62°. The results agree well with those of earlier investigators. There is a min soly. of both HCl and SO_2 in H_2SO_4 solns near the hydrate $H_2SO_4 \cdot H_2O$, with a less pronounced min. as the temp. rises This min. disappears around 60–65°. CH_3COOH, which is known to form no hydrate, does not exhibit such a min. F. C. Z.

The stability of constant-boiling hydrochloric acid. J. A. SHAW. *Ind. Eng. Chem* **18**, 1065–6(1926).—Samples of const.-boiling HCl prepd. by distn. and stored for over 3 years were found to have changed less than 0.1% from a sample freshly prepd. F. C. Z.

The natural and industrial compounds of sulfur. LUCIEN MANGÉ. *Rév. industrielle,* Aug., Sept. and Oct. 1925, *Génie civil* **88,** 48(1926). J. J. H., JR.

Manufacture of sulfur from sulfurous gas obtained as a by-product in refining metals. II. N. F. YUSHKEVICH AND V. A. KARZHAVIN. *J. Chem. Ind.* (Russia) **2,** 719-26(1926); cf. *C. A.* **20,** 3335.—Theoretical considerations show that in reducing SO_2 by C the reaction must be almost complete and the temp. must have practically no influence when the equil. is reached; at 700° a considerable amt. of CO_2 must be formed which rapidly decreases with the rise of temp., and at 1100° the gaseous mixt. should contain only 0.15% CO_2 and 79.8% CO, a further increase of temp. having no influence on the compn. of the gaseous phase. Experimentally this reaction has been studied by using coke and birch charcoal as reducing agents, whereupon it was found that in spite of the use of catalyzers the equil. of the reaction cannot be reached quickly enough to permit the verification of theoretical considerations. The expts. only gave the relative speeds of reduction of SO_2. When charcoal is used the reaction begins at 500° but it is very slow at that temp.; at 600° the speed of reduction is sufficiently great to cause the total reduction of SO_2 passed at a rate of 2860 cc. per hr.; at 700° SO_2 passed over charcoal at the rate of 5550 cc. per hr. was completely reduced; at 800° and above, charcoal reduces SO_2 completely no matter at what speed the latter is passed. At lower temps. the product of the reaction is mostly CO_2, at higher temps. CO is obtained; by operating at lower temps. there is economy in charcoal. When operating with coal the reaction is hardly noticeable below 800°. At 900° SO_2 can be completely reduced by coal if the gas is passed very slowly; at 1100° SO_2 passed at the rate of 6700 cc. per hour is completely reduced even if it is passed with the greatest speed. The S_2 vapors obtained are condensed in the form of finely divided particles which can be pptd. electrically in an app. of the Cottrell type. BERNARD NELSON

The testing of casein for the artificial-horn industry. FRANZ ROTH. *Caoutchouc & gutta-percha* **23,** 13,272-3(1926).—Methods are recommended for detg. the acidity, fats, ash, moisture and viscosity. *Acidity.*—Most methods are too complicated. Digest the powd. sample with 95% EtOH for 8-10 hrs., dil. with water and let stand about 16 hrs. and titrate with 0.1 *N* KOH, expressing the acidity as lactic acid. *Fats.*—The best results can be obtained by the Gottlieb method as applied to casein by Höpfner and Jandas. The *ash* and *moisture* tests involve nothing unusual. The *viscosity* can be carried out with any standard app., even in a pipet, the time of outflow of a casein soln. being compared with that of water. C. C. DAVIS

Dyeworks alkalies from waste (ELLIS) **25.** Nitric acid (KLEMENC, *et al.*) **2.** Decomposition of mixtures [H manufacture] (CICALI) **2.** Apparatus for melting and casting casein (Brit. pat. 243,514) **1.**

Hydrochloric acid. J. KERSTEN. Brit. 243,104, Sept. 8, 1924. C is added to a mixt. of alkali silicate and alkali chloride which is decompd. with steam to produce HCl. Air may be introduced with the steam to avoid external heating or internal heating by means of gaseous fuel. An app. is described.

Phosphoric acid. E. BRITZKE. Brit. 242,650, Nov. 7, 1924. In producing H_3PO_4 by the treatment of phosphorites with silicates and C in a shaft furnace, the oxidation of the elemental P present in the evolved gases is effected with air or O at a temp. of 1000-1300° so that substantially no oxidation of CO occurs. After removal of the H_3PO_4, the gas remaining can be used as generator gas. Cf. *C. A.* **20,** 2565.

Purifying phosphoric acid. A. B. GERBER. U. S. 1,601,208, Sept. 28. Impure H_3PO_4 soln. contg. 40% or more P_2O_5 is treated with sufficient H_2SO_4 to ppt. impurities as sulfates and leave an excess of H_2SO_4 sufficient to prevent the strong H_3PO_4 from dissolving the sulfates as formed.

Sulfuric acid. J. C. BOERTLEIN. Can. 263,599, Aug. 17, 1926. Gas contg. SO_2 is produced by operating an internal-combustion engine with molten elemental S as fuel, and using the heat of the exhaust gases from the engine to melt the supply of elemental S.

Hydrocyanic acid. DEUTSCHE GOLD- UND SILBER-SCHEIDEANSTALT VORM. ROESSLER AND O. LIEBKNECHT. Brit. 242,685, June 14, 1924. HCN is obtained by the reaction of gaseous C and N compds. such as CO and NH_3 in the presence of a neutral or alk. activated C at temps. of about 400-800°. The alk. activated C may be prepd. by heating a mixt. of sawdust and coal impregnated with alkali to about 800° in a stream of NH_3 and CO. After carbonization the temp. is preferably lowered to 550-600° for continued production of HCN. Hydrates, silicates, carbonates, borates, phosphates, sulfides or cyanides or other suitable compds. of alkalies or alk. earths may be used in the prepn. of the activated C. Cf. *C. A.* **19,** 1180.

Hydrocyanic acid product. O. LIEBKNECHT. Can. 263,136, Aug. 3, 1926. The product comprises an acidified activated adsorbent material charged with HCN.

Acid-proof tank. R. T. WALES. U. S. 1,601,228, Sept. 28. The bottom of a tank is formed of a layer of hard masses of material such as crushed rock or slag the interstices of which are filled with pliable or pitchy material, with slabs of other hard acid-proof material over this layer.

Ammonia synthesis. H. A HUMPHREY and SYNTHETIC AMMONIA & NITRATES, LTD. Brit. 243,122, Sept 24, 1924 A mixt. of N and H substantially free from CH_4, for NH_3 synthesis, is obtained by burning carbonaceous fuel continuously at a very high temp , *e g* , 1300°, with highly preheated steam and air or enriched air, and causing the CO thus formed to react with steam in the presence of a catalyst.

Separating salts of ammonium, alkali and alkaline earth metals. FARBWERKE VORM. MEISTER, LUCIUS & BRÜNING Brit 242,975, Nov. 17, 1924. A mixt. of coarse-grained $NaNO_3$ having a sp. gr. of about 2 3 and fine grained NH_4Cl having a sp gr. of about 1 5 is obtained by double decompn effected in a mother liquor comprising $NaNO_3$, NH_4Cl and NH_4NO_3 and having a sp gr of about 1 4. The mixt. is fed to an eleutriating app supplied with mother liquor and the heavy $NaNO_3$ seps while the light NH_4Cl flows out into a settling tank where the mother liquor is recovered from it Similar mixts contg Na_2SO_4 (when NH_4Cl is obtained from $(NH_4)_2SO_4$) or other like compds may be sepd by elutriation.

Nitride and ammonia manufacture. C. URFER Can. 263,820, Aug. 24, 1926. NH_3 is manufactured by causing a mixt of heated N_2 and H_2 to react with at least 1 metal of the Fe group, at least 1 chem. compd of Li contg. N_2 and at least 1 oxide of the Al family

Granular alkali. R E WILEY and C E. MENSING U. S. 1,601,898, Oct. 5. Regularly formed dry globular granules of material such as NaOH or KOH in union with an inert inorg powder such as powd talc are obtained by action of an air blast to which the alkali is fed in fused condition

Apparatus for spraying fused caustic soda into an air blast to produce granular material. R E WILEY and C E. MENSING. U. S 1,601,897, Oct. 5.

Alkaline sulfide solution. R. A. MORGAN, I. ROSENSTEIN and W. S YARD. Can. 263,221, Aug. 3, 1926 H_2S is removed from gas by treating the gas with an alk soln. contg NiS, then treating the fouled liquid with an oxidizing agent, whereby the NiS catalyzes the oxidation of the dissolved H_2S with sepn of free S, and then returning the regenerated liquid to the gas-treating state

Purifying alkali metal xanthate solutions. W. HIRSCHKIND. U. S. 1,601,068, Sept 28 An inorg. acid such as H_2SO_4 or HCl is added in proportionate quantity to react with all the carbonates, thiocarbonates, sulfides and other impurities present

Sodium bicarbonate. GES. FÜR KOHLENTECHNIK Brit. 243,677, Nov. 26, 1924. In a modification of the ammonia soda process described in Brit. pat No. 229,640 (C. A 19, 3149), NaCNS or NH_4CNS is used as the readily sol salt

Barium and strontium compounds. F. ROTHE and H. BRENEK. Brit. 242,996, Nov 12, 1924 $BaSO_4$ or $SrSO_4$ is decompd by heating with SiO_2 or a material high in SiO_2 such as Ba or Sr metasilicate (which may be obtained as a by-product in the process) to produce Ba or Sr silicates of a compn. between Ba_2SiO_4 and Ba_3SiO_5 or Sr_2SiO_4 and Sr_3SiO_5 These silicates may be treated with an acid such as HCl or HNO_3 to obtain the corresponding salts and SiO_2, or may be treated with H_2O which converts part of the material into Ba or Sr hydroxide, leaving a residue of metasilicate

Calcium nitrate. FARBWERKE VORM. MEISTER, LUCIUS & BRÜNING. Brit 242,990, Nov. 11, 1924 $Ca(NO_3)_2$ which does not readily become moist is obtained by adding a small proportion of $Ca(NO_3)_2$ crystals to a quantity of practically anhyd $Ca(NO_3)_2$ at a temp below the m p of the crystals.

Aluminum fluoride. E TEISLER. Can. 263,352, Aug 10, 1926. Fluoride of Al poor in silicic acid is manufactured by causing finely disintegrated uncalcined clay or other aluminous minerals contg besides alumina also silicic acid and aq. HF to interact and introducing into the soln a substance which contains alumina in the form of an oxide or a hydrate, and which is adapted to decomp the primarily arising fluosilicate of Al and to sep silicic acid.

Aluminum sulfate. R M. MEIKLEJOHN. Can. 263,596, Aug. 17, 1926. Alumina-bearing material and H_2SO_4 are caused to react under conditions where the ratio of H_2SO_4 contained in the mix to the total water present is greater than 1:1.3, and in which the reaction is so conducted that the material is continuously maintained above 160°.

Sulfite. L. BRADLEY and E. P. MCKEEFE. Can. 268,180, Aug. 3, 1926. Na_2SO_3 and $MgSO_3$ are produced by subjecting dolomitic limestone or lime to the action of SO_2, and subjecting the admixed sulfites to the action of Na_2SO_4 and $MgSO_4$ in the

presence of an acid with the resulting formation of $CaSO_4$ as a ppt. and a soln. contg. Na_2SO_3 and $MgSO_3$.

Sodium sulfide. F. MEYER. Can. 264,150, Sept. 7, 1926. Na_2S is made in uniform predetd. shapes by forming individual drops of the molten Na_2S, causing them to fall vertically and freely to come into contact with hard surfaces of lower temp. than the m. p. of the Na_2S.

Calcium superphosphate. A. C. HYDE. Brit. 243,192, Jan 19, 1925. Finely ground Ca phosphate in the form of a dust cloud is mixed with a fine spray of H_2SO_4 which may be of 1.84 sp. gr or of somewhat less strength.

Diammonium phosphate. H. BLUMENBERG, JR. U S. 1,601,233, Sept. 28. Finely ground crude Ca phosphate is treated with an aq soln of NH_3 in the presence of SO_2.

Treating potassiferous silicates. W. R. ORMANDY and A. M PEAKE. Brit. 212,336, Aug 2, 1921 Leucite or similar minerals are treated with phosphates of the alk. earth metals, $CaCO_3$ and H_2SO_4, in the presence of H_2O, to recover the K values in the raw material and also to produce a *fertilizer*. Either dil H_2SO_4 or niter cake may be used and phosphate rock carrying $CaCO_3$ may be employed as a raw material, with or without addn of peat or other absorbent org material

Nitrogen trichloride. J. C. BAKER. Can 263,831, Aug 24, 1926. NCl_3 is produced in gaseous form by bringing in reactive relation in a soln Cl_2 and an NH_4 compd , allowing such soln to stand until the reaction is complete, and then removing from the soln the NCl_3 by a current of air

Compartment tank for purification of zinc solutions. T. P. CAMPBELL. U. S. 1,601,938, Oct. 5.

Alumina. E. L. RINMAN. Brit. 243,356, Nov. 22, 1924. In order to obtain pure Al_2O_3 from siliceous materials such as clay, $Al_2(SO_4)_3$ is first formed and is treated with alkali sulfhydrate to ppt. crude alumina contg ferrous sulfide and liberate H_2S, the alumina is dissolved in alkali sulfide to obtain alkali aluminate and a residue contg. ferrous sulfide, and pure alumina is pptd. from the aluminate by H_2S thus reforming alkali sulfhydrate.

Alumina. R. JACOBSSON. Brit. 243,183, Dec. 16, 1924. In the production of Al_2O_3 by the process described in Brit pat No 221,209 (*C. A* **19**, 877), the aluminous raw material is treated with a weaker H_2SO_4 (which may be of a d. of 1 30) and the soln. of $Al_2(SO_4)_3$ produced is evapd. until on cooling all the H_2O is bound as H_2O of crystn After calcining the sulfate to produce Al_2O_3, the latter is purified from Fe by reducing the Fe_2O_3 and treating with gaseous HCl free from H_2O and O in the presence of $AlCl_3$ or with Cl or HCl free from H_2O and O in the presence of C, Cr or Sn or of CCl_4 or chloride of Cr or of Sn or like materials.

Mining sulfur. B. ANDREWS. U. S. 1,602,475, Oct. 12. In mining S overlying a stratum of rock-salt, a flow of H_2O below the m p. of S is passed through a drill hole into the salt below the S stratum to form a cavity in the salt stratum, and hot H_2O is then passed into the cavity to melt the S, cover the bottom of the cavity with S and laterally extend the cavity. S is brought to the surface in molten form by the action of air and pumps

Sulfur and polysulfides. R. RUSSELL. Brit. 243,394, May 23, 1924. Alkali polysulfides contg. S in colloidal form are obtained by mixing with H_2O S or S-contg material together with a compd. of B and of Na or K, heating to 100–200° and straining the liquid product. The liquid may contain up to 50% of S and may be emulsified with rubber soln. or with latex or used for medical or veterinary purposes. S-bearing ore, oil-bearing shale contg. S and S-contg. oils may be treated with Na or K compds. together with B compds to dissolve S from them.

Zinc oxide. J. F. CREGAN. Can. 263,935, Aug. 31, 1926. Zn ores are smelted in a reverberatory furnace to produce a Zn fume, the fume at high temp. is conducted to a sep. chamber, a reducing gas is mixed with it and the metallic fume is oxidized.

Ferric oxide recovery. D. G. ZALOCOSTAS. Can. 263,852, Aug. 31, 1926. $FeSO_4.7H_2O$ crystals are heated under conditions immediately to vaporize the liberated water of crystn and inhibit cementing, grinding the dehydrated product thus obtained, then oxidizing it and finally roasting it.

Activated carbon. J. N. A. SAUER. Brit. 242,659, Nov. 8, 1924. Gases used for activating C obtained from various raw carbonaceous materials are supplied to the material, either alone or mixed with heating gases, transversely to the axis of the retort used and are then caused to pass in a direction parallel with the axis of the retort in the same direction with or countercurrent to the carbonaceous material. Details of retort construction are specified. Cf. *C. A.* **20**, 3543.

Reactivating carbon, gels or other adsorption media. METALLBANK UND METAL-

LURGISCHE GES. AKT. GES. Brit. 242,986, Nov. 12, 1924 The substances set free by heating in a reactivating app. are discharged (*e g*, by the action of inert scavenging gases) before coming into contact with adjacent layers of cooler material in the regenerating app. Various structural features are described. Cf. *C. A.* **20,** 2232.

Bonded absorptive carbon. A. B. RAY. Can 263,964, Aug. 31, 1926. Absorptive charcoal is bonded by assocg. the charcoal with a soln. of a sugar and thermally decompg. the sugar to give a carbonaceous bonding residue.

Bleaching powder. A. LAMBLE and UNITED ALKALI CO., LTD. Brit. 242,805, Dec. 15, 1924. Bleaching powder is rendered stable by first partially or wholly drying it and then adding a small proportion of CaO.

Arsenic compounds. E. R. RUSHTON. Can 263,912, Aug 31, 1926. In reactions for the manuf. of As compds. As_2O_3 is applied in gaseous form in the presence of O.

Oxidizing catalyst. J. C. W. FRAZER. U. S. 1,602,404, Oct. 12. A highly active oxidizing catalyst adapted for use in oxidizing CO, NH_3, SO_2, aldehydes, alcs. or toluene consists of finely divided porous MnO_2 formed by treating a Mn compd. such as $KMnO_4$ and $MnSO_4$ with HNO_3 while cold.

Chemical-heat bag. A. RITZ. U. S. 1,602,456, Oct 12. A material for slowly generating a "mild prolonged heat" when moistened with H_2O comprises Fe particles and substances such as $CaCl_2$, S and NaCl which accelerate the chem. action on the Fe and which do not form any gaseous products by the chem. action. The Fe may be preliminarily treated with HCl

Siliceous adsorptive materials. F X GOVERS. Brit. 243,123, Sept. 25, 1924. After pptn. of a colloidal silicic acid sol and before a gel can form, H_2O is removed from the sol by spraying it into a heated chamber. The drying is carried out to such an extent that the settled solids will not form a sol or gel on contact with H_2O. The product is washed free from impurities with H_2O and again dried. Fe, Ag, Pt or other catalysts may be added at the time of pptn.

Imitation mother-of-pearl. E. F. HIGGINS. Brit 243,558, Jan. 14, 1925. Pyroxylin and fish-scale or similar substances are formed into superposed layers. Cf. *C. A.* **19,** 2264.

Catalyst. W. SCHULTZE. Can. 263,772, Aug 24, 1926. The catalyst contains material suitable for the treatment of gases contg CO, in the step wherein CO in the presence of steam is oxidized to CO_2 and is substituted by H_2. The material is of an Fe character and compressed in dry condition to a compact coherent body previous to the catalysis gases. Cf. *C A* **19,** 710

Plastic composition. A. R. KEMP. Can 263,654, Aug. 17, 1926. A filler of fused silica in a finely divided amorphous state which has the surfaces of individual particles in a cryst. state.

Molded phenolic condensation products. G L PEAKES. U. S. 1,602,249, Oct. 5. Molded phenolic condensation products are subjected to a heat-treatment to improve their insulating properties, at a temp below the normal molding temp., *e. g.*, by subjection to a temp of about 125–135° for 70–80 hrs.

Adhesive. P. S. OTTO. U. S 1,602,200, Oct 5. A nonhardening adhesive adapted for use on paper is formed from C_6H_6 76, ether 2, an NH_3 soln. 0.5, acetone 0.5 and unvulcanized rubber 21 parts.

Agglomerating sawdust or other absorbent materials. J PETITPAS. Brit. 242,665, Nov. 10, 1924 Sawdust, wood shavings, hemp waste, paper or other like materials for making compressed products are mixed with a binder such as tar incorporated with a gelatinous compn. which may be formed from albuminoid, cellulosic or amylaceous substances, gums or mucilages, with or without addn. of metal powder, abrasives, coloring, waterproofing or other substances.

Shaft furnace for drying fuller's earth. G G BROCKWAY. U. S. 1,602,842, Oct. 12.

Foam-stabilizing composition. G. J. ESSELEN, JR. Can. 263,776, Aug. 24, 1926. A foam-stabilizing compn. consists of evapd. neutralized sulfite waste liquor, and an alkali metal resinate.

Antifreeze solution. H. SCHLOSSTEIN. U. S. 1,601,328, Sept. 28. The Na salt of hydroxypropionic acid is used in viscous concd. soln. as an "antifreeze" for automobile radiators.

Articulating fluid. M. SEGAL. U. S. 1,601,650, Sept. 28. A surface contact testing compn. adapted for use as a contact indicator in fitting dental crowns or in similar operations comprises glycerol 10 cc., H_2O 5 cc, and lampblack 2 g.

Composition for permanently sealing root canals of teeth. J. R. DUNCAN and E. L. LANGDON. U. S. 1,601,301, Sept. 28. A dry mixt. of ammoniated alum 48, aristol

4, MgO 96, thymol 36, and ZnO 168 parts is formed into a paste with a suitable antiseptic soln. such as cresol or CH_2O soln.

Hot-box compound. W. J. HEATON. U. S. 1,603,077, Oct. 12. "Signal oil" is mixed with about twice its quantity of a mixt. formed from elain oil 16.5, lard oil 3 5, mineral oil 39.02, "potash" 3.10 and H_2O 37.88%.

Razor-strop dressing. J. KAZDA. U. S. 1,602,437, Oct. 12. A mixt. of carborundum 5, paraffin 75, beeswax 10 and graphite 10 parts.

Sectional retort for bone black or fuller's earth kilns. R. S. KENT. U. S. 1,602,678, Oct. 12.

Stencil sheet. D. A. WILLIAMS and J. W. ROWE. Can. 264,211, Sept. 7, 1926. A cellulose ester is dissolved in acetone and another solvent, glycerol and resin are added, and the mixt. is digested to form an impregnating substance.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

Glasses as supercooled liquids. G. TAMMANN *J. Soc. Glass Tech.* 9, 166–85 (1925).—The factors controlling the glassy state are the no. of crystn. centers formed, rate of crystal growth and viscosity of liquids. Devitrification takes place most rapidly at temps. 30–100° below the m. p. of the substance. A high supercooling capacity is seldom evident with chem. homogeneous substances. H. F. K.

The nature and constitution of glass. W. E. S. TURNER. *J. Soc. Glass Tech.* 9, 147 66(1925) —Silicate glass, a rigid soln., may be considered a mass of SiO_2 threads soaked in the silicates or their dissocn. products The existence of certain compds. as $Na_2O.2SiO_2$ has been shown in glass and other solns. while others as $6SiO_2.CaO.Na_2O$ have been indicated. It is probable that the mol wt. of fluid glass at temps. 1200–1450° is high. H. F. K.

Composition of modern glass mixtures. I. Color glasses. (a) Ruby glasses. OSKAR LECHER *Continental Met Chem. Eng.* 1, 11–2(1926).—Several formulas of ruby glasses are given and the importance of pure acid in the prepn. of the Au and the Sn salts is pointed out A mixt rich in Au and Sn, deep in color and used for flashing coat and for coloring opal glasses contains: 100 kg. sand, 120 kg Pb_3O_4, 30 kg KOH, 8 kg. KNO_3, 4 kg. borax, 100 g. Au and 2 kg. Sn dissolved in acid and 1.2 kg K tartrate. Tints are changed by varying the amount of Au salt, adding pyrolusite, by combination with opal glasses, and with Se-ruby with or without CdS. Au-ruby glass is better suited for flashed glasses and glass-blowing purposes than Cu-ruby glasses. W. H. BOYNTON

The thermal expansion of glasses at high temperatures, the formation of strains and the cooling process. H. SCHÖNBORN. *Keram. Rundschau* 33, 17(1925): *J. Soc. Glass Tech* 9, 10–2.—The differential method of measuring the expansion over the whole range of a temp. up to the softening point of the glass was used. Rods 10 cm. long of quartz, constantan and the glass under investigation were placed in 3 borings in an elec heated metal cylinder. The borings were parallel to the axis and formed a right triangle with the quartz at the 90° angle. The rods were fixed at one end and free to move at the other, to which was attached a mirror. A reflected spot of light traced the expansion curve on a photographic plate Typical curves are given for Thuringian, lead, boro-silicate, lead oxide-alumina-borate and tungsten glasses. "Temporary" and "permanent" strains are discussed. In the former case the range below the annealing temp is most important, in the case of the latter the temp. range above the critical zone (where the expansion begins to increase rapidly) was decisive. Various cooling processes for annealing glass are discussed M. O. LAMAR

The annealing and re-annealing of glass. W. M. HAMPTON. *Trans. Opt. Soc.* (London) 27, No. 3, 161–80(1925–6).—The formulas deduced in previous papers (cf *C. A.* 19, 2114) are applied to the heating of glass under a const. gradient and the temp. at which strain disappears is obtained. The effect of the known change in coeff. of expansion on this temp. is discussed. A comparison is given between calcd. and exptl. curves, and a discussion of the effect of change in the rate of heating and in the size of the specimen. The annealing equation is discussed from the dimensional point of view. Agreement of theory and expt. is considered and an explanation advanced for discrepancies at low temps. A general expression to cover all cases is deduced. D. E. SHARP

New ultra-violet transmitting glass. H. P. Hood. *Science* **64**, 281–2(1926).—A new glass (980 A) has been developed at the Corning Glass Works, which transmits rays of 200$\mu\mu$ in 3 mm. thickness. This glass has a d. 2.64, n_D 1.539, a dispersion for $N_p - N_c$ of 0.009 and possesses a stability within the range of ordinary glasses. The cost of production is above that of window glass but far below that of quartz.
L. W. Riggs

The inside frosting of incandescent lamps. Marvin Pipkin. *Ind. Eng. Chem.* **18**, 774–6(1926).—Incandescent lamps of satisfactory strength are made from inside-frosted bulbs by subsequently treating them with a soln. that will dissolve glass. This soln. may or may not be the same as the frosting mixt., though for smooth finish the acidity must be lower than for the frosting operation. Means of conducting strength tests, a comparison of exterior and interior frosting and some frosting and strengthening mixts. are given.
W. H. Boynton

Some observations of surface deposits formed in glass-furnace regenerators. H. Insley. *J. Am. Ceram. Soc.* **9**, 635–8(1926).—Deposits found on the surface of 2 highly aluminous bricks were mostly nephelite, carnegieite and corundum. The first 2 can form only at temps. lower than glass-melting temp. but corundum may be formed at melting temp.
C. H. Kerr

Glass wool as insulator for refrigeration purposes. H. C. Bates. *J. Am. Ceram. Soc.* **9**, 690–2(1926).
C. H. Kerr

Wearing away of tank blocks. D. W. Ross. *J. Am. Ceram. Soc.* **9**, 641–53 (1926); cf. *C. A.* **20**, 2398.—Wearing away is largely by soln. of downward-facing surfaces and is largely eliminated by eliminating horizontal joints. The deeper any horizontal joint is below the metal line, the less is the wearing away. Excessively reducing atm. accelerates soln. at the glass line, especially with excess of salt cake. Used tank blocks show that thimble like gas blebs are frequently, if not always, present in the cavities of downward-facing surfaces.
C. H. Kerr

The mullite content of some American tank blocks. F. S. Thompson and H. I. Vormelker. *J. Am. Ceram. Soc.* **9**, 639–40(1926).—Method of analysis: a 1-g. sample was added to 20 cc. HF and let to stand for 12 hrs. at 20°. The residue was weighed and analyzed. The % residue (mullite) from various tank block mixts. varied from 2.82 to 12.78. Refiring the original samples for 24 hrs. at 1450° increased the residue (mullite) from the above figures to 15.2–22.01%. Results are approx. and not conclusive.
C. H. Kerr

Future progress in ceramic chemistry. Geo. W. Morey. *Ind. Eng. Chem.* **18**, 1023–5(1926).
E. J. C.

Zircon as a constituent of ceramic bodies. W. L. Shearer. *Ceramist* **5**, 316; *J. Soc. Glass Tech.* **9**, 153–4.—The phys. and chem. properties of zircon, baddeleyite and quartz are tabulated for comparison. In S.'s expts. the zircon used was from beach sand deposits at Pablo Beach, Fla. Test pieces contg. 30, 60 and 70% zircon were made and fired to cone 12, and their phys. properties tabulated. In general, the use of feldspar in a zircon body was detrimental to its resistance to thermal shock. The high density of zircon did not preclude its use in casting mixts.
M. O. Lamar

Modeled treatment of pottery. M. L. Fosdick. *J. Am. Ceram. Soc.* **9**, 697–700 (1926).
C. H. Kerr

The spalling of bricks. F. W. Preston. *J. Am. Ceram. Soc.* **9**, 654–8(1926).—The surface of sepn. bears no simple relation to the isothermal surfaces. In a "semi-infinite" slab, the diffusivity has no influence on the tendency to spall, but does influence the location of the surface of parting.
C. H. Kerr

A study of the shrinkage of diaspore clays. I. S. M. Phelps. *J. Am. Ceram. Soc.* **9**, 659–66(1926).—Shrinkage is inversely in the order of Al_2O_3 content. Shrinkage is influenced greatly by the duration of the firing period and the state of subdivision. The bond or plastic portion and the grains of diaspore differ widely in firing properties. Heat treatment of diaspore should be ample to produce the shrinkage that would occur in service.
C. H. Kerr

Choosing and testing firebrick. H. E. Weightman. *Power* **64**, 549–51(1926).—The importance of intelligently limiting the specifications is urged. Refractories should not be called upon unduly for load-bearing.
D. B. D.

What is good firebrick? H. E. Weightman. *Power* **64**, 508–10(1926).—The selection and testing of refractories are discussed.
D. B. Dill

Specifications for lining and checker brick for water-gas manufacture. E. J. Brady. *J. Am. Ceram. Soc.* **9**, 667–78(1926).—Specifications are suggested, based on the experience of United Gas Improvement Co.
C. H. Kerr

Redesigned driers. H. M. KRANER AND A. H. FESSLER. *J. Am. Ceram. Soc.* **9,** 679–83(1926).—For dry-press porcelain. C. H. KERR

A successful application of powdered coal as a tunnel kiln fuel firing hard-fired common brick. F. M. HARTFORD. *J. Am. Ceram. Soc.* **9,** 684–9(1926). C. H. K.

Feldspar. A. S. WATTS. *Mineral Ind.* **34,** 277–9(1925).—Sources, production, and grinding are discussed. A. B.

The melting point of enamels. A. OTREMBA. *Keram. Rundschau* **33,** 201; *J. Soc. Glass Tech.* **9,** 96–8.—This is an account of the relative effects of fluorspar, cryolite, and sodium fluosilicate on the m. p. of an enamel composed of: quartz 19.1, B_2O_3 4.32, borax 34.4, feldspar 34.6, Al_2O_3 3.19, and fluorspar 3.5%. The fluorspar was increased progressively to 72% at the expense of the other ingredients. Also the quartz and feldspar contents were varied over a wide range. O. concludes that fluorspar acts sometimes as a flux, again as a refractory material. Similar expts. were carried out with cryolite and sodium fluosilicate. No mention is made as to what method was used for detg. the m. p. M. O. LAMAR

Gas produces better results at less cost [in sheet iron enamel furnaces]. G. D. WILKINSON. *J. Am. Ceram. Soc.* **9,** 693–6(1926). C. H. KERR

The life of refractories in the glass industry. K. ENDELL. *Sprechsaal* **51,** 321; *J. Soc. Glass Tech.* **8,** 289–93.—Comparative data are given for the properties of German, Dutch and American tank blocks, including type of clay, chem. analysis, porosity, softening point and deformation temp. Extensive tables record similar properties for 11 different SiO_2 bricks and 20 aluminiferous bricks. M. O. LAMAR

Foundry refractories. M. C. BOOZE. *Fuels Furnaces* **4,** 1071–6(1926).—The selection of refractories for foundry furnaces and the conditions imposed upon them in practice are discussed. H. F. K.

Physical chemical investigations of "Borowitsch" refractory clays. G. G. URZSOV. *Z. anorg. allgem. Chem.* **154,** 152–69(1926).—Different types of "Borowitsch" clay exhibiting great variations in ceramic properties, are discussed in light of heating and dehydration curves. PER K. FRÖLICH

The ternary system Na_2SiO_3–$CaSiO_3$–SiO_2 (MOREY, BOWEN) **2.** Plasticity (DE WAELE) **2.** Refractories for generator linings (BAUMGARTNER) **21.**

Glass. JENAER GLASWERK SCHOTT & GEN., O. SCHOTT and H. THIENE. Brit. 24[illegible], Aug. 4, 1925. A glass insensitive to abrupt temp. changes contains at least SiO_2 45, B_2O_3 2–15, MgO and CaO (or BaO or ZnO) together 4–30, Al_2O_3 20–30% and not more than 8% of alkali oxide. Oxides of Pb or Sb up to 6% also may be used.

Glass. E. THOMSON. U. S. 1,603,221, Oct. 12. Glass-making material is fed downwardly into a reaction zone where it is heated to fusion while the upper zone of the material is protected with unfused material, and the material is cast downwardly when a clear glassy product has been formed.

Tank furnace for glass manufacture. J. BOUCHER and A. BOUCHER. Brit. 243,-322, Nov. 22, 1924.

Apparatus for feeding molten glass from furnaces. C. H. RANKIN. Brit. 243,459, Sept. 3, 1924.

Boiler-gage glasses. W. C. FOX. Brit. 243,105, Sept. 9, 1924. The interior of the glass is etched or sand-blasted to render the liquid level in the glass more clearly visible.

Sheet glass with figured designs. E. DANNER. Brit. 243,638, June 30, 1925. Mech. features.

Apparatus for continuous drawing of glass sheets. SOC. ANON. ATELIERS J. HANREZ. Brit. 242,574, July 28, 1925.

Apparatus for drawing tubes and the like of silica glass. H. GEORGE. U. S. 1,601,523, Sept. 28.

Flux (containing boron phosphate) for enamel, glass and ceramic materials. H. BLUMENBERG, JR. U. S. 1,601,231, Sept. 28. U. S. 1,601,232 specifies a flux containing an alkali metal boron phosphate. The B compds. lower the temp. required for fusion.

Marking spectacle lenses. E. D. TILLYER. Brit. 242,576, Sept. 8, 1925. H_3PO_4 is used for markings on glass which become visible by slight moistening such as by breathing on the glass and which disappear when the glass becomes dry.

Joining glass to metals. ALLGEMEINE ELEKTRICITÄTS-GES. Brit. 243,553, Jan. 2, 1925. After fusing together glass and a metal, the 2 materials are brought to different temps. such that on cooling the effects of their different coeffs. of expansion are compensated.

Purifying clay. W. FELDENHEIMER. Brit. 242,357, Aug. 7, 1924. Clay is simultaneously treated with 2 or more reducing agents such as Na sulfide, oxalate sulfite, bisulfite, metabisulfite, hyposulfite, or thiosulfate, Ca sulfide dissolved in alkali carbonate soln., K sulfide, SO_2 and oxalic acid. The treatment may effect purification by deflocculation, with or without addn. of other deflocculators such as Na pyrophosphate or oxalic acid. Brit. 242,358 specifies improving the color of clays by treatment in aq. suspension, with an acid sulfite such as $NaHSO_3$ or metabisulfite and a metal such as Zn which reduces H_2SO_3 but does not form colored salts. A trace of HCl or other inorg. acid may be added.

Clay for tiles or pottery. H. SPURRIER. Brit. 242,916, July 1, 1925. See U. S. 1,559,652 (*C. A.* 20, 100).

"Modeling clay." E. E. SNOOK. U. S. reissue 16,435, Oct. 5. See original pat. No. 1,568,098 (*C. A.* 20, 650).

Downdraft kiln for burning clay products. P. J. LENGSHOLZ. U. S. 1,601,028, Sept. 28.

Decorating pottery. LOVATT & LOVATT, LTD., AND A. E. LOVATT. Brit. 242,898, May 27, 1925. Earthenware articles are dipped in glaze and allowed to dry, then decorated with a mixt. of a pigment and a "matt" medium (*e. g.*, a metal oxide mixed with quartz, lime, clay and liquid gum) by a transfer process and the glaze and decoration are fired together in a single operation, thus producing a decoration with a matt finish on a glazed ground.

Earthenware formed from pulverized material. H. R. STRAIGHT. U. S. 1,602,720, Oct. 12. In forming earthenware from pulverized material to be burned such as shale, the material is first pulverized to a granular state and then subjected to the action of superheated steam to raise its temp. nearly to or above the b. p. of H_2O. H_2O is then introduced and the material is pugged, molded while hot, and dried.

Continuous tunnel kiln of the muffle type. L. A. VINCENT. U. S. 1,601,748, Oct. 5.

Tunnel kiln for burning ceramic wares. H. R. STRAIGHT. U. S. 1,602,721, Oct. 12.

Oil-burning kiln and tunnel for burning brick. R. W. WIEDERWAX. U. S. 1,602,-293, Oct. 5.

Refractory products from zirconiferous ores. F. C. F. LE COULTRE. U. S. 1,602,-273, Oct. 5. Zr-bearing ore is heated to a high temp. in an elec. furnace with a circular enclosure and then discharged from the furnace into a violent stream of H_2O contg. 0.1% H_2SO_4.

Enameling or glazing metal articles. W. LAMBERT, A. A. MEAD and J. STONE & CO., LTD. Brit. 243,033, May 20, 1924. In hot enameling metal tubes or other metal articles, while they retain sufficient heat from a previous treatment to effect complete vitrefication of the enamel, a reducing or neutral agent is delivered to the metal simultaneously with the coating material to prevent oxide formation and to reduce oxide already present.

Furnace and oven for fusing enamel ware, etc. H. C. BEASLEY and R. MACDOUGALL. U. S. 1,603,015, Oct. 12.

Furnace for enameling metal ware. H. C. BEASLEY and R. MACDOUGALL. U. S. 1,603,014, Oct. 12.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Cement. R. W. LESLEY. *Mineral Ind.* **34,** 111–23(1925).—A review of the industry in the U. S. and foreign countries. A. B.

The development of hydraulic cementing materials. G. HAEGERMANN. *Zement* **14,** 143–7(1925).—Historical discussion, giving the specifications and properties of the normal and special cements. H. F. K.

Modern portland cement manufacture. S. DICKSON. *J. Soc. Chem. Ind.* **45,** 310–2T(1926).—The importance of fine grinding of raw mix and clinker is stressed and an elutriation app. is described. RAYMOND WILSON

Testing of portland cement. R. H. HARRY STANGER. *J. Soc. Chem. Ind.* **45,** 312–5T(1926).—Descriptive. RAYMOND WILSON

Raw batch and clinker analyses. O. FREY. *Zement* **14,** 141–3(1925).—The influence of the ash upon the compn. of the clinker is irregular though in general the greater the difference between the content of SiO_2 and of R_2O_3, the greater is the effect of the ash. H. F. K.

Setting time of cement indicated by a machine operation. A. A. JAKKULA. *Eng. News-Rec.* **97,** 66(1926).—An app. is described and illustrated which automatically indicates the time of set of cement. R. E. THOMPSON

The initial set and time of hardening of different cements at low temperatures with and without calcium chloride. OTTO GRAF. *Zement* **14,** 213–4(1925).—An aluminous cement set as quickly at 1° as at 18° while the time required for setting by a special portland cement, a normal portland cement, and a blast-furnace cement increased 3-, 7-, and 5-fold, resp. With $CaCl_2$ hardening was hastened in all cases, though not to the same extent with the various cements. H. F. K.

The application of Röntgen rays to cement research. R. NACKEN. *Zement* **14,** 419 22, 437–9(1925).—The general methods of Röntgen-ray analysis are described but no new data are presented. H. F. K.

Cement specifications changed by Missouri Highway Commission. F. V. REAGEL. *Eng. News-Rec.* **96,** 657(1926).—To meet conditions in Missouri, two changes were made in cement specifications for 1926, namely: (1) a min. tensile strength of 225 lbs. at 7 days was specified, and (2) a provision was added to the effect that fluctuations in setting time causing finishing difficulties in field would be held cause for rejection. R. E. T.

A device for measuring pressures used in molding cement mortar briquets. F. H. JACKSON AND D. O. WOOLF. *Public Roads* **7,** 104–6(1926).—Diagram. A. E. G.

The compound $8CaO.2SiO_2.Al_2O_3$. WALTER DYCKERHOFF. *Zement* **14,** 102–4, 120–2(1925).—This compd. reported by Jänecke in 1911 (*C. A.* **6,** 673) was not confirmed by Rankin and Wright in 1912 (*C. A.* **6,** 1829). A mixt. composed of $2SiO_2.Al_2O_3$, and 8CaO heated to its m. p. yields a homogeneous substance melting incongruently at about 1900°. Its properties are: sp. gr. 3.090, n_D^{20} alpha 1.703 ±0.002, gamma 1.707 ±0.002, monoclinic, optically neg., biaxial with large optic angle and with the plane of the angle normal to the elongation. H. F. K.

Procedure for analysis of mortars. J. L. HEITZMAN. *Eng. News-Rec.* **97,** 271 (1926).—Weigh 1 g. of crushed and dried sample, add 50 cc. dil. HCl (1–9) and boil until all sol. material is in soln. Filter, ignite and weigh. This wt. × 100/95 = sand content. Evap. the filtrate to dryness, cool, add 20 cc. dil. HCl (1:1), warm until Fe salts are in soln. and then add 50 cc. distd. water. After boiling, filter, ignite and weigh. This wt. × 500 = approx. percentage of portland cement. Dirty sand would introduce an error in this calcn. Det. CaO and MgO in the filtrate in the usual manner. Calc. the CaO and MgO in the cement by multiplying the latter by 0.625 and 0.032 resp., and subtract these amts. from the total CaO and MgO found. The combined remaining CaO and MgO × 100/95 = approx. percentage of lime. R. E. THOMPSON

Tests of vibrolithic concrete. L. W. TELLER. *Eng. News-Rec.* **96,** 779(1926).—The vibrolithic process was found to give a more uniform product, which exhibited greater strength at 28 days for a given cement content than normal concrete. R. E. T.

Comparison of transverse and compressive tests of concrete. H. F. CLEMMER. *Public Roads* **7,** 67–8(1926).—Tests of compressive strengths on concrete show variations as high as 138% on samples from the same specimen of concrete. That no such difference in the actual strength of the concrete exists is shown by the transverse tests, which check within 5% in 12 out of 14 cases. A. E. GRAY

Tests of concrete in tension. A. N. JOHNSON. *Public Roads* **7,** 90–2(1926).—The ratio of tensile strength to compressive strength of concrete is fairly constant, 6–10%. A diagram of the app. for tension tests is shown. A. E. GRAY

Bitumen determinations in coarse asphaltic concretes. A. R. EBBERTS. *Eng. News-Rec.* **97,** 513–4(1926).—A method is described for detg. whether the bitumen content of asphaltic concretes conform to specifications. By dividing the amt. of bitumen specified by the total superficial area of the ideal grading as detd. by the specifications, a value termed the bitumen index is obtained. Comparison of the bitumen content found on extn. with value obtained by multiplying the superficial area of the aggregate after extn. by the bitumen index, detd. as above, shows whether the specimen is of the desired compn. A chart is given for detg. the superficial area of the aggregate from the sieve analysis. R. E. THOMPSON

Strengthening and indurating concrete with sulfur. W. H. KOBBE. *Eng. News-Rec.* **96,** 940–2(1926).—The strength of concrete can be considerably increased by impregnating with S. The treatment process consists of immersing the concrete in a bath of S maintained at 130–150° for several hours. Standard tensile briquets of cement mortar which ordinarily break at 150 lbs. are increased in strength to over 1000 lbs. and as high as 2000 lbs. per sq. in., by this treatment, and strength under compression is similarly increased. Water absorption is usually reduced to less than 2–3%. R. E. T.

Concrete strength made uniform by careful proportioning. ZARA WITKIN. *Eng.*

News-Rec. **97,** 258–9(1926).—Data are given on the quality of concrete produced during construction of a building on which 3 field methods were employed, (1) volumetric measurement of aggregates, (2) wt measurement of fine aggregate, and (3) inundation of fine aggregate. The following conclusions are drawn from the observations made: (1) Accurate control of the water content of the aggregates, with the same theoretical mix, effected a reduction of 6 7% in the amt. of cement required. (2) With accurate water content control and const mix, the strength is an inverse function of slump. (3) With accurate water content control the strength with the same theoretical mix is slightly higher and considerably more uniform R. E. THOMPSON

The permeability of portland cement concrete. W. H. GLANVILLE. Dept. Sci. Ind Research, *Building Research Tech Paper* No. **3,** 50 pp (1926).—Results of tests are summarized under the following heads: (1) Constituent materials. Minimum permeability is obtained with the quantity of water giving minimum volume of concrete (minimum voids). Too little mixing water causes a greater increase in permeability than too much water. The influence of water content decreases with age It is greater for lean mixes than for rich ones Cement and water content are of approx equal importance. Increasing the cement above that in a 1·2 4 mix does not materially affect the minimum permeability. Decrease in permeability is more rapid in rich mixes than in lean mixes. Proportioning of aggregates is less important than the cement and water content. The sand content is more important than the gravel content, the presence of sufficient fine materials being necessary for low permeability Inert powdered admixtures decrease the permeability of lean concrete. (2) Methods and processes of prepn. Prolonged ramming reduces permeability of the drier mixes, but does not appreciably affect minimum void mixes Trowelling reduces the permeability of dry mixes, but has little effect on wet mixes Specimens cast on edge are more permeable than those cast flat. Wire brushing the surface increases the permeability. (3) Subsequent treatment The permeability of water-cured concrete decreases with age, becoming nearly constant at 1 month That of air cured concrete does not decrease after 14 d Curing is the most important of the factors considered. Storage in water as early as possible gives concrete of the lowest permeability Poorly cured concrete requires long periods of storage under water to make its impermeability equal to that of water-cured concrete Impermeability produced by good curing is permanent for 1·2·4 mixes Initial permeability is proportional to pressure After 7 days' test, specimens tested at 25, 50 and 100 lb. per sq. in were of equal permeability Reduction of permeability of specimens during testing is caused by a combination of silting, hydration and swelling, the amt attributable to each depending on the conditions of test and the compn of the concrete. RAYMOND WILSON

The deterioration of structures in sea water. *6th (interim) Rept of the Comm. of the Inst. of Civil Eng* **1925,** 40 pp —The rept contains repts on examn. of steel and Fe specimens exposed to air and sea water at Colombo, Halifax, Plymouth and Aukland by P. M CROSTHWAITE; on Teredo and Limnoria toxicity studies by GEO. BARGER; on examn of steel plates painted with protective coatings and exposed to sea water at Southhampton, by F. E. WENTWORTH-SHEILDS; on impregnation of timber with various poisons and exposure of test pieces, by S M. DIXON; and on conditions of specimens of timber exposed at Leith, by A. H. ROBERTS. ALFRED L. KAMMERER

The action of water and salt solutions on aluminous cements. G. HAEGERMANN AND HART. *Zement* **14,** 201–6(1925) —Aluminous cement is appreciably sol in distd. H_2O, 3 g of cement in 300 cc. H_2O for 3 hrs yielding 0 6 mg SiO_2, 72 4 mg R_2O_3, 53.2 mg. CaO and 1 0 mg. MgO per 100 cc of soln. In tap H_2O the soly is much less. The soly. in $Ca(OH)_2$ soln decreases with increasing concn In sea water and solns. of $CaSO_4$, $MgSO_4$, $MgCl_2$, the soly is low. Solns. of alkalies attack the cement. Sugar solns. (0.5% and up) retard the setting more than 48 hrs. H. F. K.

The strength of mortar and concrete as influenced by the grading of the sand. J. G. ROSE. *Public Roads* **7,** 106–7(1926) —A graph is given of relative strength and grading of 200 Colorado sands and gravels which were tested for tension and compression. The graph shows that there is an optimum grading of sand that will produce max. strength in concrete. A. E. GRAY

Prehydration of cement in new method of concrete mixing. W. B. JONES. *Eng. News-Rec* **96,** 850(1926).—During the construction of the Montebello filtration plant at Baltimore, Md., a large part of concrete was mixed by hydrating with the required amt of water prior to mixing with the aggregate. This method produces a product of uniformly good quality, eliminates possibility of lumps of cement in the concrete, provides facilities for handling the grout in bonding new concrete with an old pour, and makes possible a decided reduction in time of mixing. Fifteen seconds in the

mixer was found to be sufficient to give concrete of normal strength. The prehydration process and machine employed (described) have been patented. R. E. THOMPSON

The effect of calcium chloride on concrete. A. S. LEVENS. *Eng. News-Rec.* **97,** 214–5(1926).—The effect of 2, 3, 4 and 5% of $CaCl_2$ as an integral part of mix on the tensile strength of concrete was detd. The strongest concrete was that which contained 2% of $CaCl_2$, the higher percentages tending to weaken the concrete. During the earlier periods (3–7 days) the strength of concrete contg. 2% $CaCl_2$ was 40% greater than plain concrete. Similarly the strength under compression showed an increase of 106%. The shrinkage was 100% greater than plain concrete at 3 days, 50% at 7 days and 85% at 14 days and thereafter. R. E. THOMPSON

Vary mix design for concrete to be used at different ages. R. T. GILES. *Eng. News-Rec.* **97,** 510–1(1926).—Results of comparative tests of concrete made with and without accurate control of water are given. With accurate control the strength was 77% greater at 7 days and 30% at 28 days. In a series using fine aggregate only, of 21 gradations, the 7-day strengths were higher in every case with accurate control, while in some cases equal strengths were obtained at 28 days. One-year specimens will be tested in each series. Conclusions drawn from the expts. include (1) that fineness modulus is not a true measure of gradation but an indication only, and (2) that for ultimate strength accurate control of fine aggregate is of much more importance than accurate control of water. R. E THOMPSON

Specifying concrete by water-cement ratio alone. F. R. MCMILLAN. *Eng. News-Rec* **96,** 698–700(1926) —The procedure is described which is employed in applying specifications based solely on water-cement ratio in construction of new building of Portland Cement Assocn. in Chicago. The proportion of aggregates was governed entirely by the requirements of workability, with single limitation that the coarse aggregate should not be less in amt than the fine, nor more than twice the fine. The max. water-cement ratios specified were: (1) for 2900 lb. per sq. in. concrete, 6 U. S gals. per sack (94 lbs.) of cement; (2) for 2000-lb per sq. in concrete, $7^1/_2$ gals per sack. A curve for proportioning concrete by water-cement ratio is given and its application to small jobs is described. R. E. THOMPSON

Manufacture of cement from slurry in rotary kilns. T. RIGBY. Brit. 243,410, July 28, 1924. Mech. features for partly drying slurry before it comes into contact with the kiln wall

Magnesia cement mixtures. K. WERNER. Brit. 243,107, Jan. 24, 1925. MgO and $MgCl_2$ soln. are mixed with a filler which contains at least 30% of silicic acid in a form capable of reacting with excess $MgCl_2$. The residues obtained in the manuf. of alum and $Al_2(SO_4)_3$ may be used.

Oxychloride cement. J. A. RITCHIE. U. S. 1,602,212, Oct. 5. A compn. adapted for making molded articles is formed by treating a "body ingredient" such as sawdust with sufficient H_2O to render it damp to the touch but not enough to render it pasty and then mixing this material with MgO and $MgCl_2$. Cf. *C. A.* **19,** 3006.

Waterproofing cement mixtures, etc., with rubber latex. S. M. KIRKPATRICK. Brit 242,345, Aug. 6, 1924. A paste for incorporation as a waterproofing agent with cements, concretes, clay, earth and other materials is formed of raw or vulcanized rubber latex, a preservative such as "hexamine," Na silicate, K soap and H_2O, with or without gum arabic or other stiffening agent.

Cement kilns. I. E. LANHOFFER. Brit. 242,962, Nov. 14, 1924. Preliminary and final heating of the cement-forming material are effected in sep. kilns and a steam generator (with auxiliary firing provided for) is placed between the 2 kilns with a by-pass for direct passage of a portion or all of the hot gases to the preliminary heating kiln as desired.

Waterproofing concrete. A. B. TURK. U. S. 1,602,726, Oct. 12. The pores of concrete are impregnated with an insol. Ca salt such as Ca silicate and the material is then treated with a coating mixt. formed of paraffin, turpentine, CS_2 and gasoline.

Porous concrete. E. I. LINDMAN. Brit. 243,308, Nov. 24, 1924. A porous concrete comprises cement and a so-called "fermenting powder" such as Al to which is added not more than 80% of granulated coal or coke slag, ashes, coal, coke, furnace scoria, volcanic ashes, lava, chalk, pumice, trass, clay, pot-stone or wood at least 10% of which will pass a 9-mm. mesh. The "fermenting powder" may be added as a colloidal soln.

Mortar-forming process. J. H. DITTER. Can. 263,700, Aug. 24, 1926. An agent or admixture for mortar formers and mortar consists in a mixt. of Mg combinations and alkali silicate in colloidal form.

Slaking lime. R. & J. DEMPSTER, LTD. AND A. L. HOLTON. Brit. 242,865, March

26, 1925. An app. is described in which lime may be slaked with spent liquor from an $(NH_4)_2SO_4$ plant and heated and agitated with steam.

Calcareous plastic material. W. A. COLLINGS. U. S. 1,601,295, Sept. 28. A temporarily waterproofed fine granular material such as bentonite treated with mineral oil which is capable of swelling on access of H_2O is mixed with concrete as a filler and waterproofing agent.

Plaster. LAMBERT FRÈRES ET CIE. Brit. 243,015, Nov. 13, 1924. A slow-setting plaster is obtained by calcining gypsum at a temp. of 500–800° until it is completely dehydrated and acquires a sp. gr. of 2.7–2.8. It may be added to ordinary plaster.

Stucco. J. P. BEATY. U. S. 1,601,285, Sept. 28. Ground cork $1^1/_2$ lbs. is mixed with 100 lbs. of a mixt. of cement 2 and cinders 5 parts.

Paving materials. C. E. RAMSDEN. Brit. 243,418, Aug. 1, 1924. See U. S. 1,598,505 (*C. A.* **20,** 3552).

Paving material. F. W. CHAMBERLAIN. U. S. 1,603,192, Oct. 12. Sand grains are coated by heating and mixing them with a bituminous adhesive contg. 50–70% of dust by vol. and having a penetration of 120–130 and the heated coated sand grains are discharged into cold H_2O to harden the coating on the individual grains.

Paving. K DAMMANN. Brit. 243,391, Nov. 22, 1924. Non-bituminized "road metal" is bound with slightly bituminized granular stone. The binder also may be used for the wearing surface.

Combining bituminous emulsions with sand, sawdust or other solid materials. P. L. GEER and H. F. WIGGINS. U. S. 1,602,105, Oct. 5. Mech. features of prepg. compns. for paving, coating walls or roofs, etc.

Preserving wood. A ARENT. U. S. 1,602,959, Oct. 12. Wood is impregnated, at least superficially, with a concd soln. of NaCl and $SbCl_3$.

Preserving wood. H. D. HECKERT. U. S. 1,602,577, Oct. 12. Wood is subjected to the action of compressed air under a pressure of at least 40 lbs. per sq. in and then, without releasing the air pressure, is treated with a liquid preservative such as creosote oil at a pressure of at least 150 lbs per sq. in. until a portion of the desired impregnation has been effected, then is subjected to a "vacuum pressure of about 15 in. of Hg" for at least 20 min. and further subjected to liquid preservative under a pressure of at least 110 lbs per sq in

Preserving wood. TERMIT, LTD., AKTIESELSKAB. Brit. 243,595, Feb. 17, 1925. Wood is rendered resistant to attack by white ants by use of a soln. of alum contg. $Al_2(SO_4)_3$ and a small proportion of Al acetate obtained by reacting on alum with Pb acetate. Camphor and other substances may be added

Composition for preserving wood. A. C. HOLZAPFEL. U. S. 1,603,109, Oct. 12. A Hg compd. such as the oxide, and Zn stearate are used with varnish fumes and fuel oil.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

The rational analytical classification of fuels. C. BLACHER. *Feuerungstechnik* **13,** 69–70, 84–6, 95–8, 126–7, 148–52(1925).—Each fuel is represented by a point on a diagram, the coordinates being the percent of volatile matter in the fuel, and the percent of hydrocarbons in the volatile matter. In computing the latter, it is assumed that all the N appears in the volatile matter as such, and that all the O appears as water except for an O content of 1% in the coke Some progress has also been made on a direct method for detg the O in coal by heating in a stream of H_2. The two coördinates give the amt. of gas to be burned and the richness of this gas. On the diagram most fuels lie on a curved band passing from wood to anthracite, with a branch including cannels and oil. There are about 100 references to the literature, and 60 fuel analyses from many sources, some unusual. ERNEST W. THIELE

Unusual features of combustion chemistry. R. T. HASLAM AND J. T. MCCOY. *Power Plant Eng.* **30,** 941(1926).—The increase in the sum of the 2 gases as CO_2 decreases and O_2 increases is due to the "net" H which burns with the O_2 of the air to form water. K. C. BEESON

Fuel tests. HANS BROCHE. *Arch. Wärmewirtschaft* **7,** 237–9(1926).—In a plea for precise specifications for methods of analysis, B. gives the volatile matter content of 3 coals as detd. by 4 different much used methods. The variations may be over 3%, out of 20%. ERNEST W. THIELE

Firing-up tests of steam boilers. EBEL. *Arch. Wärmewirtschaft* **7,** 229–37(1926).—

E. gives the details of tests of the fuel required to bring banked boilers to full production. Gas, powd. coal and grate furnaces are included. ERNEST W. THIELE

A new combined sawdust-powdered coal furnace for steam boilers. ASCHOFF. *Techn. Blätter* **15,** 49; *Wärme & Kälte Tech.* **27,** 174–5(1925).—The mixed coal and sawdust are fed into the top of the furnace without air, the air being supplied through the furnace walls, which are double. The heat evolved per unit vol. of combustion space is high. Abstracts of 4 boiler tests are given. ERNEST W. THIELE

Coal and coke. R. W. MORRIS. *Mineral Ind.* **34,** 133–76(1925).—A review of the industry during 1925. A. B.

The why, when and how of storing bituminous coal. W. T. CONLON. *Power* **64,** 354–6(1926).—*Spontaneous combustion* can be avoided by preventing air circulation. A pile of coal 20 ft high, closely packed in layers, showed no indication of fire during a period of 26 months. D. B. DILL

Chemical evolution of the coal industry. M. PÉRILHOU. *Rev. ind. minerale* **1926,** 296–301. C. W. OWINGS

Vegetable substances and coal in their relation to chemistry. L. CRUSSARD. *Rev. ind minerale* **1926,** 219–34, 283–95, 303–16.—It is possible (1) to fix well defined chem classes, and in a very small number (cellulose, glucose, aglucone, coniferyl alcohol, pentose) which form, in vegetables, the essentials of the bases of combustibles; (2) to define a small number of transformations (oxidation, hydrolysis, aldolization, polymerization) which, acting simultaneously on these bases, according to known laws, create an extreme variety of new substances; (3) to group these substances into a small number of natural families (oxy- or hydrolignic acids, acids formed from the oxidation of hydrolignic acids, corresponding neutral compds , saccharo-humic compds.), whose phys. and chem properties may be described, as in simplified botany the natural families of plants are defined and described without assigning them to any class; (4) to illustrate transformation methods by simple laboratory experiments, and to show what the natural families are, by a small number of simple compds. (acetic acid, protocatechuic acid, vanillic acid, pyrocatechol, guaiacol, pyrogallol, quinone, dibenzofuran, etc) whose properties it is especially useful to know. C. W. OWINGS

Microstructure of coal. C. A. SEYLER. *Gas J.* **173,** 419–20(1926).—In abstracted form a résumé of present knowledge and investigations is given. A. E. GALLOWAY

X-ray studies of coal and coke. ANCEL ST. JOHN. *Trans. Am. Inst. Mining Met. Eng.* **1926,** (preprint), No 1587-F, 13 pp —A brief discussion and review of the study of coals by direct radiographs, Laue photographs and x-ray spectrographs W. B. P.

A comparison of vitreosil, illium-alloy and platinum crucibles for determination of volatile matter in coal. H. M. COOPER AND F. D. OSGOOD. *Fuel Science Practice* **5,** 381–5(1926).—Detns. of volatile matter were made upon coke, lignite anthracite and different types of bituminous coals, in crucibles made of Pt, illium-alloy and vitreosil All crucibles were of approx 10-cc. capacity, similar in shape and equipped with capsule lids. Tests were made by the standard A. S. T M method at 950° in a vertical elec furnace. In testing coke, anthracite and coking coals the results obtained with vitreosil and illium-alloy crucibles agreed within the limits of exptl error with those obtained by using Pt crucibles. In testing lignite and noncoking coals the results with illium-alloy crucibles checked more closely than with vitreosil, both being much lower than the results obtained with Pt crucibles. The use of vented lids on vitreosil crucibles caused little difference in results. Neither variations in rate of heat transfer through the different crucibles nor wall thickness materially affected the results Vitreosil and illium-alloy crucibles gave reliable results except for high-volatile noncoking coals. The use of Pt permits more rapid working because its lower sp. heat necessitates a min. amt of time for heating, cooling to weighing temp., and burning off. D. A. R.

The Dutch standards for the determination of volatile matter in coal. S. DE WAARD. *Feuerungstechnik* **14,** 275–8(1926).—The literature relating to the factors influencing this detn. is reviewed, and the official method adopted by the Dutch Institute for Fuel Economy is given. This is substantially the American method, using gas, with min. details as to crucible weight and dimensions, gas flow, etc. ERNEST W. THIELE

The colloid-briquet process. FELIX BRAUNEIS. *Montan. Rundschau* **18,** 529–30 (1926).—In briquetting brown coal approx. 25% is ground to "colloidal" size, this acting as a binder for the rest, the pressure required for briquetting being reduced to about 20% of that normally used Some data are given. W. B. PLUMMER

Future trends in automotive fuels. A. C. FIELDNER AND R. L. BROWN. *Ind. Eng. Chem.* **18,** 1009–14(1926). E. J. C.

Tests of benzene as a motor engine fuel. ANON. *Oil Eng. Techn.* **7,** 355(1926).—The report of the British National Benzole Research Committee. The resin-forming

tendency of benzenes was studied by means of engine tests on refined and unrefined benzenes. It is concluded that gum formed in the engine valves arises from nonvolatile resinous matter already present in the benzene. Very little gum is formed by polymerization and oxidation of volatile unsatd constituents caused by contact with hot parts of the induction, etc. The method of C deposition is described. It is tentatively concluded that benzenes free from weighable quantities of nonvolatile resinous matter at the time of use are suitable for motor fuels. M. B. HART

Preparation of liquid hydrocarbons by the direct hydrogenation of coal by the Bergius process. A. GRÉBEL. *Génie civil* **88,** 176(1926). JACK J. HINMAN, JR.

An engine that runs on dust. W. A. NOEL AND RUDOLPH HELLBACK. *Power* **64,** 402–4(1926)--Expts indicate the possibility of designing an engine which uses grain dust for fuel D. B. DILL

The Landmann system of combustion. ANON. *Feuerungstechnik* **13,** 297(1925).—The system consists in drawing off from the grate with a fan the gases arising from the carbonization of the coal on the first part of any chain or step grate, and putting them back under the grate ERNEST W. THIELE

The determination of the combustion temperature, allowing for dissociation. WILHELM GUMZ *Feuerungstechnik* **14,** 261–3, 273–5(1926)—The method of calcg the theoretical flame temp is described, graphs being used Two useful simplifications are pointed out: the dissocd gases have very nearly the same heat capacity as they had before dissocn.; and the heat rendered unavailable by dissocn. is nearly the same, whatever the excess air ERNEST W. THIELE

Flue gases and draft. P H. PARR. *Intern. Sugar J.* **28,** 80 3(1926).—Chimney height should be based on difference in wt between hot stack gases and outside air. The principal uncertainty is the av temp of the gases in the stack. The mean temp may be taken, for lack of better data, as 5–10% lower than at the base. Too large a cross-section may cause poor draft from excessive cooling due to low gas velocities. W. L. BADGER

Recovery of flue gas heat. WEBER. *Warme & Kalte Tech.* **27,** 11(1925).—A patented cross-flow cast-Fe air preheater is described The air passes through many square ducts with internal ribs, set rather close, with flue gas passing around them. ERNEST W. THIELE

Operation of the Ljunstrom air preheater. B. G. BROLINSON. *Iron & Steel Can.* **9,** 227–36(1926)—This particular preheater employs the regenerating principle, carrying the heat from the escaping flue gases to the incoming air. This is accomplished by a slowly rotating regenerator contg. a very large heating surface within narrow limits At the same time the counter-flow principle is applied. An av recovery of 70% of sensible heat in the flue gases is accomplished With preheated air introduced to the furnace more fuel can be burned on the same grate area. Photographs are shown and the operation is described H C PARISH

The distribution of temperature in shaft stoves. H. STRACHE. *Feuerungstechnik* **13,** 253–5(1925)—Mathematical. By making various assumptions a formula is developed giving the temp at any point at any time of a mass of well-conducting material, such as a blast furnace stove, heated by means of a gas passing through it. E. W. T.

Domestic heating. MARGARET FISHENDEN. *Gas J.* **173,** 540–1(1926).—In abstracted form the essentials of a lengthy paper are given citing thermal waste, central heating, coke stoves, intermittent heating and coal conservation A. E. GALLOWAY

Determining presence of air in gas. F. P. PETERSON. *Oil & Gas J.* **25,** No. 12, 146(1926). -Gas-analysis equipment is listed and described for the detn of O, CO_2 and CO M. B. HART

The Strache gas generator in the gas industry. A. GRÉBEL. *Génie civil* **87,** 368–73(1925).—The app developed by Hugo Strache of Vienna is described and shown by drawings and photographs. JACK J. HINMAN, JR.

New methods of gas purification. F. W. SPERR, JR. *Gas Age-Record* **58,** 73–6, 80(1926).—Liquid purification process improvements and the Sperr recovery process reactions and operation are discussed. Operating costs of gas purification by the latter process are tabulated. H. G. BERGER

Utilizing a by-product of gas manufacture. F. H. RIPLEY. *Gas Age-Record* **58,** 79(1926).—Coke breeze is recommended for insulation of cold storage floors. H. G. B.

Recuperative oven plant at Kalamazoo, Michigan. ANON. *Gas Age-Record* **58,** 41–2(1926).—Descriptive, with operating data. H. G. B.

Past and present trend of development in gas manufacture. J. A. PERRY. *Gas Age-Record* **57,** 583–6(1926).—An historic review showing the progress made in the gas

industry from its inception to the present. Modern methods of mfg. gas are discussed and held to be sound regardless of claims for low-temp. carbonization. H. G. BERGER

Producer gas and by-product recovery. JOHNSTONE-TAYLOR. *Gas Age-Record* **57,** 587(1926).—The Neilson system for a by-product producer plant is described diagrammatically. Hot producer gases are passed through coal in a rotating inclined retort effecting devolatilization of the coal to some extent. The coke produced is used in gas producers for the production of gas used in steam generators, as well for the distn. of the coal. By-products are recovered; 35-40 M cu ft of 200 B.t.u. gas per ton of coal are recovered. Surplus coke is produced and may be used as domestic fuel. H. G BERGER

Refractories for generator linings. I. Clinker formation and general properties of refractories. H. H. BAUMGARTNER *Am. Gas J.* **125,** 255-8(1926).—The least clinker trouble results from generator coal whose ash consists of nearly equal parts of SiO_2 and Al_2O_3 with small amts to traces of CaO, MgO, alkali and Fe, and which fuses at 2300-2500° F. Refractories themselves are the most adaptable of many factors in clinker control. SiC and Al_2O_3 are efficient, especially Al_2O_3, since it resists slag action, does not shrink or oxidize, and is strong. The ideal structure is grossly crystalline within the refractory to resist phys shock with a dense surface to prevent penetration. **II. Fundamentals of design of shapes and cooling shapes.** *Ibid* 280-3.—The advantages claimed for linings of SiC compared with firebrick are: much longer life, increased capacity of generators, practical elimination of clinker troubles, easier cooling and fuel economy. H. F K.

Relation between heating value of gas, the required volume of combustion air, and the combustion products. HANS FAHRENHEIM. *Gas u. Wasserfach* **69,** 838-40(1926).—A discussion with detailed tabulations W. B. PLUMMER

A new gas burner system. A. MIRBACH. *Feuerungstechnik* **14,** 279(1926).—In the burner described the gas enters the narrow end of the frustum of a cone through an adjustable annular opening The air enters through many small ports in the side of the cone, which is of ceramic material. Both gas and air are under pressure. E. W. T.

Tests of blast furnace gas burners for boilers. FRIEDRICH LÜTH. *Arch. Wärmewirtschaft* **7,** 192-4(1926)—The pressures required for different gas rates and amts of excess air are given for 4 burners, together with the results of several boiler tests with each ERNEST W THIELE

European gas developments. C. H. S. TUPHOLME. *Gas Age-Record* **57,** 657-8 (1926); cf. *C. A.* **20,** 1899- Description of carbonizing retorts. H. G. BERGER

Some characteristics of gas combustion. O. L. KOWALKE. *Gas Age-Record* **57,** 725, 730(1926).—A review. H. G. BERGER

Recent developments in the pier process. R. A. WAIT. *Gas Age-Record* **57,** 615(1926). H. G. BERGER

Reflections on ammonia recovery at gas works. J. S. UNGER. *Gas Age-Record* **58,** 142 6(1926). H. G. BERGER

Neutralization of sulfate of ammonia and supplementary notes on manufacture. C BATEMAN. *Gas World* **84,** 280-3; *Gas J.* **173,** 748-51(1926); cf. *C. A.* **19,** 3367.—B gives the results of his study with data and the method developed. Particular attention is given to the neutralization of the salt. By expt $(NH_4)_2CO_3$ was shown to be suitable for neutralization both as to efficiency and labor saving, and after a period of one month. A diagram of a semidirect NH_3 recovery system is shown. A. E. G.

Neutralization of ammonium sulfate. A. THAU. *Gas u. Wasserfach* **69,** 832-4 (1926).—Discussion of difficulties with an acid product, and of methods of neutralization. W. B. PLUMMER

The continuous distillation of water-gas tar. ANON. *Gas Age-Record* **57,** 837, 848(1926).—A plant bringing the tar into contact with a molten metal kept at a definite temperature is described. H. G. BERGER

Future trends in low-temperature carbonization. S. W. PARR. *Ind. Eng. Chem.* **18,** 1015-6(1926). E. J. C.

The agglutinating value of coal. M. BARASH. *Gas World* **84,** 68; *Gas J.* **173,** 276-80(1926); cf. *C. A.* **20,** 2741.—A coal of the highest proportion of agglutinant (β and γ compds) does not necessarily form the best coke. Coal is composed of a fusible portion with cementing properties and inert material. B. aims to establish the impossibility of detg. the amt. of cementing material and its strength and covering power and that the inert material exerts a remarkable influence. B. stresses the latter object, and suggests better cokes would result by removal or destruction of part of the agglutinant, weathering, chem., or other treatment of the coal, and by blending. The method is detailed and curves and photographs are given. A standard agglutinant for comparison

of inert matter is defined, and the relation between swelling power and agglutinating value is discussed. A bibliography is given. A. E. GALLOWAY

By-product coke-oven practice. XII. R. A. MOTT. *Fuel Science Practice* **4**, 528–46(1925); cf. *C. A.* **20**, 494.—A discussion of (1) coke quality as related to coal used, (2) fractures in coke, (3) the path of travel of the gases in the oven. D. A. R.

Relation of by-product coke ovens to the natural gas supply of the Pittsburgh district. H. J. ROSE. *Trans. Am. Inst. Mining Met. Eng.* **1926** (preprint), No. 1593-F-G, 10 pp.—Since the present trend in coke-oven construction and operation is toward oven heating with producer gas, large supplies of coke-oven gas become available as potential replacements for natural gas. W. B. PLUMMER

The Sulzer system of dry coke cooling. ERNST BLAU. *Gas Age-Record* **58**, 135–6, 145(1926).—A discussion of quenching *versus* dry cooling. The Sulzer system is described and sketches are given. Actual operating plants are discussed. H. G. B.

Relation of chemistry to development of power (HASLAM, *et al.*) **13.** Specifications for lining and checker brick for water gas manufacture (BRADY) **19.** Recovery of gas from the Decatur Imhoff tanks (HATFIELD) **14.** The year's progress in illumination (CADY, *et al.*) **4.** Progress in ore dressing and coal washing in 1925 (RICHARDS, LOCKE) **9.** Determination of phenol in crude cresol (QVIST) **7.** Gas, vapor and liquid (JÜPTNER) **2.** Cracking and hydrogenating coal (Brit. pat. 242,876) **22.** Apparatus for distilling coal (U. S. pat. 1,602,819) **22.**

Carbonizing coal. W. RUNGE. Brit. 242,621, Nov. 6, 1924. Pulverized coal is preheated by suspension in a heated oxidizing gas, *e. g.*, air at a temp. of about 345° in the case of bituminous coal to destroy its agglutinating properties, and the powd. fuel is then carbonized by showering it through an ascending current of gas at a higher temp., *e. g.*, the combustible gas formed at a temp. of about 535°. Distillates may be recovered. An app. is described. Brit. 242,622 specifies introducing coal into the top of a carbonizing chamber wherein it gravitates through a zone having a temp. of 455–635° countercurrent to a gas formed by burning a portion of the material or a combustible gas or both at the bottom of the chamber in a limited supply of air. Distillates are withdrawn at the top and partially distd. coal at the bottom. An app. is described. Brit. 242,623 specifies showering powd. fuel through a limited supply of oxidizing gas in a reaction chamber, the upper portion of which is flared to provide a larger cross-section in which the gases have a reduced velocity as they pass around a preheater through which the fuel is fed. Cf. *C. A.* **19**, 3582

Low-temperature distillation of coal. J. NEATH and W. CHANEY. Brit. 242,435, Nov. 8, 1924. In operating a vertical retort for low-temp. distn. of coal in connection with a water-gas producer, the producer gas during the "blow" passes through regenerators in which it is burnt by successive addns. of secondary air and is carried to a combustion chamber in the retort setting, and during the "run" the water gas is passed through the charge. An app. is described.

Coking coal or lignite. SOC. L'AIR LIQUIDE SOC. ANON. POUR L'ETUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE. Brit. 243,665, Nov. 28, 1924. At the end of the heating process the atm. present in the retort or oven is displaced by a current of N, air or combustion products so that the H and CH_4 are liberated from the coke. The gases used may be superheated and H and N may be obtained from them by partial liquefaction for use in NH_3 synthesis.

Coking coal. KOPPERS CO. Brit. 243,414, July 30, 1924. A charge of coal is externally heated in a mass which is thinner at its lower than at its upper part, and, when the thinner part is practically completely coked, steam is introduced into this part. Provision is made for withdrawal of distillates.

Benzene. I. W. HENRY. U. S. 1,601,213, Sept. 28. Hydrocarbonaceous material such as powd. bituminous coal mixed with 10% of $CaCO_3$ is heated in a high-frequency oscillating elec. field to generate gas and the C particles suspended in the gas are ionized and treated with H from an external source to form an enriched hydrocarbon gas. This gas is scrubbed to remove free C, tarry substances and other residue and C_6H_6 is condensed from the scrubbed gas.

Apparatus for destructive distillation of coal, peat, shale or other bituminous materials. A. M. SMITH. U. S. 1,602,128, Oct. 5.

Ionizing retort for distillation of hydrocarbonaceous or other materials. I. W. HENRY. U. S. 1,601,212, Sept. 28.

Fuel mixture. E. MALLOCK. U. S. 1,601,501, Sept. 28. Salt water peat is mixed

with about an equal quantity of coal and the material is carbonized in an oven for several hrs. to form a clinker-like product adapted to be further mixed with coal to improve the circulation of air through it when burned.

Carbonizing fuel briquets. E. GEVERS-ORBAN. Brit. 242,869, April 6, 1925. A vertical retort is used which is heated externally from the top downwards and briquets are introduced immediately into the hot zone. A portion of the distillates, taken off at the top, is returned into the bottom of the retort.

Fuel briquets. L. A. WOOD and MINERALS SEPARATION, LTD. Brit. 242,352, Aug. 6, 1924. Briquets, *e. g.*, those obtained by flocculating finely divided fuel in H_2O or other fuel briquets contg. hydrocarbon binders, are subjected, under nonoxidizing conditions, to the action of superheated steam at a temp. of 100–300°, and evolved vapors may be condensed and recovered, while the H_2O content of the fuel is reduced and rendered "smokeless" and waterproof.

Distilling and coking fuel. A. J. A. HERENG. Brit. 242,411, Oct. 11, 1924. In distg. fuel by direct heating by hot gases produced in an auxiliary externally heated combustion chamber, the quantity of air mixed with the fuel in the combustion chamber is adjusted so that CO or CO_2 mixed with N is produced and enters each of a series of retorts contg. the fuel undergoing distn. and gases from the distn. retorts serve for preheating fuel in other retorts.

Dissociating steam as a fuel. T. J. J. WASLEY and F. G. SIBILLA. Brit. 242,333, July 31, 1924. Steam is projected onto highly heated surfaces of refractory material or metal which is not readily fusible or upon solid fuel in a boiler furnace to effect dissocn. of the steam so that its elements may immediately recombine The furnace is preliminarily heated to incandescence electrically or by steam and oil or other fuel.

Motor fuel. E. JOHANSEN. U. S. 1,601,215, Sept. 28. Compds. of a metallic oxide, *e g*, PbO or an alkali plumbite, with "sour distillate compds.," are dissolved in petroleum hydrocarbon material such as gasoline or in C_6H_6, alc. or ether. U. S. 1,601,-216 specifies treating "sour distillates" with oxides such as PbO to form a fuel component These fuels are suitable for engines working at high compression.

Liquid motor fuel. J. F. P. DE RIBOISIERE. Brit. 243,357, Nov. 18, 1924. See U. S. 1,534,573 (*C. A.* **20**, 495).

Drying or low-temperature distillation of fuel. METALLBANK UND METALLURGISCHE GES AKT.-GES. Brit. 242,618, Nov. 4, 1924. Fuel is dried or subjected to low-temp. distn by the action of hot gases generated in a furnace between 2 retorts and connected with them by chambers through which gases are passed to be heated and to mix with the hot combustion gases from the furnace before entering the retorts. A drying and carbonizing app. may be superimposed and heated by the same furnace.

Fuel briquets. L. WEBER. Brit. 243,129, Oct. 13, 1924. Briquets are formed with holes or channels so placed that the walls bounding the holes do not exceed in thickness the "burning depth" of the fuel mixt. which may be formed, *e. g.*, of gas coke up to 6 mm grain with about 25% of coal dust and 4% sorel cement which, when formed under a pressure of 75 kg. per sq. cm, has a "permissible burning depth" of 1 cm. and when formed under a pressure of 25 kg. has a burning depth of 2 cm.

Hydrocarbons. F. BERGIUS. Can. 263,477, Aug. 17, 1926. Gas for the hydrogenation of C and hydrocarbons is obtained from gases contg. CH_4 and H_2 by subjecting them to treatment with steam at different temps. in successive stages, and also to a treatment to remove CO_2.

Hydrocarbon and alcohol mixture. M. D. MANN, JR. Can. 263,426, Aug. 10, 1926 A compn. of matter comprises a liquid petroleum hydrocarbon, a primary alc. and secondary butyl alc. in mixt. which is stable without a blending agent.

Coal gas. W. J. MURDOCK, E. E. LUNGREN and O. B. EVANS. U. S. 1,602,242, Oct 5. Coal of relatively high volatile content is arranged in an annular column between inner and outer refractory heating walls so spaced as effectively to heat the entire column by radiation and the column is vertically blasted with air and steam, alternately.

Gas producer. F. H. WAITE and G. W. DAVEY. Brit. 242,473, Dec. 29, 1924.

Gas producer. SOC. ANON. D'EXPLOITATION DES BREVETS COUSIN DITE LE CHAUFFAGE INDUSTRIEL. Brit. 242,597, Nov. 6, 1924. The air blast for a producer is moistened by bubbling through H_2O in the ash pit.

Gas producer operation and synthetic ammonia production. H. A. HUMPHREY and SYNTHETIC AMMONIA & NITRATES, LTD. Brit. 242,741, Sept. 24, 1924. In generating producer gas from showers of powd. or atomized fuel, the blast of steam and air or O required for the reaction is preheated to above 900° by the sensible heat of the prod-

uct. Two regenerators are used and the cooler parts of the regenerators may be lined with a catalyst for producing NH_3 by reaction of the gas produced with steam.

Gas retorts. T. R. WOLLASTON. Brit. 243,169, Dec. 1, 1924. In vertical or inclined gas-making retorts, the fuel is stirred and pre-coked in the upper portion (to which heat is supplied by the hot gases from and by contact with the lower portion and, if desired, also by external flues or an external heating chamber) and passes downwardly from one stage to another of the retort under the action of stirrers in a vertical shaft.

Rotary gas scrubber. GAS LIGHT & COKE CO. AND E. W. EVE. Brit. 242,404, Oct. 7, 1924.

Apparatus for treating gas with purifying or enriching liquids. G. J. HILL and F. J. MOORE. U. S. 1,602,530, Oct 12

Apparatus for testing the calorific value of gases. BOARD OF TRADE AND C. V. BOYS. Brit. 243,028, Nov. 17, 1924.

Apparatus for making air gas. H. FOERSTERLING. U. S. 1,601,303, Sept. 28.

Separating dust from flue gases, etc., by water sprays. BRITISH SOOT BLOWER CO., LTD. AND A. U. MERRYLEES. Brit. 243,128, Oct 10, 1924. An app is described.

Apparatus (with concentric chambers) for distillation and gasification of peat, brown coal, lignite and similar materials. F. KRAUSS Brit. 243,534, Dec 8, 1924.

Incandescent gas mantles. T. TERRELL. U. S. 1,601,746, Oct. 5. An incandescent mantle in the marketable soft condition has a fabric of lustra cellulose, the elementary fiber of which has a thickness of 0 5 3 deniers Italian silk measurement.

Catalytic decomposition of tars, mineral oils, etc. M. MELAMID. U. S. 1,602,310, Oct. 5. The sepn of C and pitchy substances in the catalytic decompn of tars, crude mineral oils, etc., is prevented by highly dispersing the material in the presence of H so that it is in a foggy, gas like condition and treating the material at a high temp with a metal catalyst which liquefies at the reaction temp (which may be about 500° with crude petroleum) and which does not form carbides.

Coke briquets. MIDLAND COAL PRODUCTS, LTD. AND C. INGMAN. Brit. 242,783, Nov 7, 1924 A caking coal is mixed with about 2 33 times its wt. of a coal of low coking index (both finely divided) and about 5% of a binder such as pitch is added to the mixt. Compressed briquets are formed from it which are then treated in a vertical retort supplied with air or steam or both and carbonization is effected by consuming a small proportion of the material of the briquets

Coke oven heating wall of silica. A. ROBERTS. U. S. 1,601,741, Oct. 5. Specific dimensions are given.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

F. M ROGERS

The future of the chemistry of petroleum. J. F. NORRIS. *Ind. Eng. Chem.* **18**, 1019-21 (1926). E. J. C.

Petroleum and petroleum products. ARTHUR KNAPP. *Mineral Ind.* **34**, 513–45 (1925).—A review of production and refining of petroleum and products in the U. S. and foreign countries A. B.

The Pechelbronn petroleum refinery. R. P. *Chaleur et industrie* **7**, 487–98 (1926).—Description of the oil mining and refining processes used at Pechelbronn. A. PAPINEAU-COUTURE

The liability to explosion of carburetted atmospheres in petroleum and distillate storage tanks. A. WILLIAMS-GARDNER. *J. Inst. Petr. Techn.* **12**, 336–40(1926).—An examn. has been made of the atm. existing in storage and process tanks contg. inflammable liquid, which shows that no explosive mixts. are present. A Bone and Wheeler gas analysis app. was used. The gas content consists of a higher proportion of the lowest paraffins. M. B. HART

Mineral cordage oils. W. L. BROOKE. *Philippine J. Sci.* **30**, 213–8(1926).—The requirements for cordage oils are: good penetrating ability, permanent neutrality, low S and volatile matter; for ship rope also low emulsifiability with water. Oils with paraffin base are believed to cause the desirable yellow color, those with asphalt base the blackish gray discoloration of the rope on aging. The 8 oils on the market had the following consts.: volatility loss 0.20–0.53%, d 0 888–0 940, viscosity$_{100}$ 91–146 (Sayboldt), flash point 152–174°, fire point 172–202°, 0 18–0 50% S, *R. E.* no. (emulsifiability with water detd. according to the Tagliabue (Brooklyn) Manual for Petroleum Inspectors) 4.0–7.0. MARY JACOBSEN

The oil fields of the Maracaibo Basin. C. M. HUNTER. *J. Inst. Petr. Techn.* **12,** 235–46, Discussion 246–56(1926). M. B. HART

Sodium carbonate as flooding agent revises estimate on oil reserves. ARTHUR KNAPP. *Oil Weekly* **1926,** No. 9, 28–9.—The action of Na_2CO_3 as a flooding agent is described. The soda soln replaces the oil which wets the sand grains and permits the recovery of the oil by flotation. The salt water is pushed ahead of the carbonate soln., and thus prevents the deposition of insol. compds. M. B. HART

Use of soda ash. C. E. KERN. *Oil & Gas J.* **25,** No. 13, 31, 157(1926).—A satd. soln of soda ash in cold water hydrolyzes to about 0.4 *N* NaOH, which is the optimum concn for driving petroleum from oil sands M. B. HART

Microthermal observations of some oil shales and other carbonaceous rocks. TAISIA STADNICHENKO AND DAVID WHITE. *Bull. Am. Assoc. Petr. Geol.* **10,** 860–76 (1926); cf *C. A.* **20,** 3275—These exptl. studies are planned (1) to show whether the various fossil constituents in an oil shale or other carbonaceous rock are characterized by differences in their chem. constitution that will result in differences in temps. at which they volatilize or undergo change of state; (2) to det. whether and how far the same kinds of fossil constituents react at the same temps in shales more highly carbonized by natural processes, (3) to secure such information as may be gained by the same methods as to the stages of carbonization at which the various fossil components fail to give evidence of chem distinction; (4) to show what physical constituents of the "shale" yield oils or other condensable distillates by heat treatment; and (5) to secure data for the detn of the proportions and qualities of the distillate (with references as to natural oils) that are derived from one fossil commodity or another. The methods are new and are not yet fully developed and the exptl. results are but partly interpreted. For the completion of objectives 4 and 5, retort distns of check samples and chem. anns of the products are required to supplement the microfurnace observations. C L C.

The Konradson demulsification test for turbine oils. L. A. GLOUCHMAN AND S L ALECHENA. *Azerbaidj. Neft. Choz.* **51,** 75–7(1926); *Chimie et industrie* **16,** 58 (1926) Pass steam for exactly 10 min into a 250-cc graduated cylinder contg. 20 cc H_2O and 100 cc of oil, place in a water bath at 55° for 1 hr., and note the amt of H_2O (either clear or milky), of emulsion and of oil, and the H_2O content of the oil. With a given oil the rate of sepn of the emulsion may vary, but the final result is const.; the H_2O content of the sepd oil cannot always be detd. with the desired degree of accuracy; on the whole the method yields fairly accurate results. Application of the test to turbine oils prepd by treating ordinary machine oil with 1, 2 and 3% of SiO_2 gel showed that the oil was improved and did not give any emulsion. The method is suitable for adoption as a standard test, except that it is unnecessary to det. the H_2O content of the oil and the height of the emulsified layer is the only important consideration. A. PAPINEAU-COUTURE

The use of antioxidants in oils. ANON. *Rubber Age* (N. Y.) **20,** 27, 30(1926).—Aldol α-naphthylamine ("*Agerite*") has already proved itself of great value in retarding the oxidation and therefore the deterioration of vulcanized rubber. Similarly its addn. to mineral oils, in which it is sol, stabilizes the oils so that their elec. resistivity after prolonged heating is far higher than the corresponding untreated oils under the same conditions The property has already been utilized on a com. scale in the production of [illegible] C. C. DAVIS

The production of gasoline substitutes and solvents. R. T. ELWORTHY. *Gas Age-Record* **58,** 137–8, 146(1926).—Discussion of various investigations. H. G. B.

Ethyl gasoline. P. TRUESDELL. *Nat. Petr. News* **18,** No. 38, 21(1926).—Manuf. described.

... unsatd. hydrocarbons, by H_2SO_4 of 90, 92, 94 and 100% strength. Based on these results the proposed method consists of detn. of unsatd. hydrocarbons by treatment with 94% H_2SO_4 (using 2 vols. of acid and cooling with ice) if the sample contains less than 20% aromatics. If the sample (of blended motor fuel) contains more than 20% aromatics, 92% acid is used to det. the unsatd. content. In either case a 2nd sample is treated similarly with 100% acid to det. both unsatd. and aromatic content, the latter then being found by difference. W. B. PLUMMER

New testing method solves tough problem for gas plants. E. D. CUMMINGS. *Petr World, Calif.* **11,** No. 9, 108–10(1926).—A distn. method for detg. the % gasoline held in rich absorbing oil is described. M. B. HART

The charcoal process pro and con. EMBY KAYE. *Nat. Petr. News* **18,** No. 35, 21(1926).—The charcoal absorption process is run at a 50% saving in initial investment as well as a saving in maintenance over the oil process. Difficulties encountered in the charcoal process include the corrosion of screens and the reactivation of the charcoal. M. B. HART

Use pipe still to reduce fuel oil. C. O. WILLSON. *Oil & Gas J.* **25,** No. 16, 152–3 (1926).—The Kanotex installation is described which uses Gray polymerizers with the Jenkins cracking units. M. B. HART

Water tubes in pipe stills would cool oil tubes and make needed steam. B. N. BROIDO. *Nat. Petr. News* **18,** No. 34, 78, 80, 82; No. 35, 43, 45–6, 48; No. 36, 67–8, 71–2, 73(1926).—Efficient operating conditions for pipe stills are discussed. The Reiher and Reitschell heat-transmission coeff is developed. M. B. HART

Physical and chemical properties of paraffin wax, particularly in the solid state. J. A. CARPENTER. *J. Inst Petr. Techn.* **12,** 288–315(1926).—On fractionation of wax from Burma crude, compds. ranging from $C_{21}H_{44}$ to $C_{34}H_{70}$ were obtained. The transition from needle-shaped prisms to rhomboid plates or leafy masses occurs at 10–15° below the m p. The crystal form depends upon the solvent used, rate of cooling and on the wax used. Data are tabulated to show transition points, expansion and d. of various waxes. Wax dissolves 7–15% of its own vol. of air at ordinary temp. A test for detg. the breaking strengths of waxy materials is described. Amorphous mineral jellies and cryst. waxes belong to different chem. classes of compds. and cannot be transformed from one to the other. M. B. HART

Further investigation of the liquid reaction products obtained by the action of hydrogen on paraffin wax under high pressure at 450°. Contribution to the knowledge of Berginization. H. I. WATERMAN AND A. F. H. BLAAUW. *Rec. trav. chim.* **45,** 284–95 (1926). (In English) —400 g. Rangoon paraffin (84 6% C, 14 8% H) were heated in an autoclave (cf. W. and Perquin, *C. A.* **20,** 3560) under an initial H_2 pressure of 110 atm. for 90 min at 445–55° (observed pressures 280–90°). On the av. 360 g. was recovered from the app. 3502 g. obtained in this way gave 1343 g. boiling below 150° and 2036 g higher-boiling material which contains, apparently much unchanged paraffin. The gasoline boiling up to 150° was carefully fractionated and full details are given. Conclusion: Gasoline fractions obtained on "berginizing" paraffin wax under the conditions used contain large quantities of the successive members of the satd methane hydrocarbons and also probably about 10% of olefins. C_6H_6 and PhMe are absent or present only in extremely small quantities. E. J. WITZEMANN

Lubrication. F. A. HOFF. *Oil Trade* **17,** No. 9, 26(1926) —Castor oil blends as lubricants give better lubrication and protection to moving parts with a min. of C formation than pure castor oil. Castor oil does not break down readily under heat nor congeal in cold weather, forms a tight piston seal, and having no affinity for gasoline remains on the cylinder and prevents crankcase diln. M. B. HART

The application of colloid chemistry to lubrication. RAYMOND SZYMANOWITZ. *J. Chem. Education* **3,** 909–14(1926). E. J. C.

The study of lubrication by electrical methods. H. SCHERING AND R. VIEWEG. *Erdöl und Teer* **2,** 602–4, 619, 620(1926).—A detailed discussion of methods of calcn. and of graphical treatment of results in the study of lubricating films by detn. of the elec. capacity of the oil film, this being obviously a function of the thickness of the film and the properties of the oil. W. B. PLUMMER

"Saturation" of the petroleum lubricant hydrocarbons as shown by their reaction with bromine. C. F. MABERY. *J Am. Chem. Soc.* **48,** 2663–4(1926).—A fraction of a Pa. oil, b_{30} 280–2°, and 1 of an Ill oil, b_{30} 275–80° in CCl_4, treated with Br, give a Br substitution product and liberate 1 mol. HBr; the Br derivs. decomp. 100–20° with elimination of HBr; they react readily with EtOH-KCN and diln. with H_2O ppts. the alkyl cyanide. Sapon. of these cyanides gives dense, oily acids. This would indicate that this fraction of petroleum is satd. C. J. WEST

Fire-point carbon test. SAMUEL P. MARLEY, C. J. LIVINGSTONE AND W. A. GRUSE. *Ind. Eng. Chem.* **18,** 1094(1926).—Critical comments are made on the test proposed by Byrd and Vilbrandt (*C. A.* **20,** 2745), and objections to claims of parallelism between test results and performance of the lubricant in engine cylinders. L. R. ADKINS. *Ibid* 1094–5.—Similar to foregoing. W. B. PLUMMER

Asphalt. PREVOST HUBBARD. *Mineral Ind.* **34,** 86–94(1925).—Consumption of asphalt and related hydrocarbons, production, tests and specifications are discussed. A. B.

Artificial asphalts prepared with sulfur. SEDLACZEK. *Teer* **24,** 436–7(1926).—

A no. of German patents covering products from S with coal tar, pitch, various oils etc., are cited and briefly discussed. W. B. PLUMMER

Wood tar and its technical application. E. J. FISCHER. *Teer* **24**, 434–6, 453–7 (1926).—A general discussion of the compn. and properties of various wood tars and of their utilization in waterproofing, medicinals, etc. A no. of patents covering utilization are cited. W. B. PLUMMER

Relation of chemistry to development of power (HASLAM, *et al.*) **13.** Organic theories of oil origin (CLARK) **8.** The fluorescence of oils in ultra-violet light (CRONER) **27.** Adhesion (HARDY, NOTTAGE) **2.** Partial evaporation of trade waste eliminates taste in water [wood-distillation waste] (MCNAMEE) **14.** Were diatoms the chief source of California oil? S. pat. 1,602,310) **21.** Apparatus for destructive distillation of shale (U. S. pat. 1,602,128) **21.**

Cracking hydrocarbon oils. W. F. FARAGHER, W. A. GRUSE and F. H. GARNER. U. S 1,601,727, Oct. 5. A body of oil in a still is heated to cracking temp. by external heating of the still and circulation of the oil within the still is effected by introduction of upwardly flowing currents of gas, *e. g*, fixed gas formed by the oil cracking, which act on the "air-lift" principle, between vertical division plates within the still spaced at their upper and lower ends from the still walls. U. S. 1,601,728 specifies a similar process in which oil is introduced at one end of the still and residue withdrawn from the other end. In this instance the division plates are placed transversely within the still, which is of the horizontal cylindrical type.

Treating hydrocarbon oils and similar materials. F. BERGIUS. U. S. 1,592,772, July 13 Heavy mineral oils or like materials may be formed into a paste with solids such as diatomaceous earth, coke powder or coal ashes (with or without an alk. desulfurizing reagent) and then treated with a hydrogenating gas in a reaction vessel heated by a jacket through which compressed CO_2 may be circulated as the heating medium. An app is described.

Separating hydrocarbon oils from water and other associated impurities. W. E. TRENT U. S 1,591,728, July 6. Hydrocarbon oil is commingled with finely divided coal or other like material to cause the oil and carbonaceous portion of the solid fuel to unite in a plastic "amalgam" while rejecting H_2O and other impurities. The oil may be distd from the "amalgam" or the latter may be used directly as a composite fuel.

Converting hydrocarbon oils with aluminum chloride. A. M. MCAFEE. U. S. 1,601,636, Sept. 28. Such a limited quantity of $AlCl_3$ and limited degree of heating are employed so as to produce a distillate at least as much of which b. 200–270° as b. below 200° In treating an oil such as gas oil, about 1.8% of $AlCl_3$ may be used in the treatment

Treating hydrocarbon oils with aluminum chloride. E. R. WOLCOTT. U. S. 1,601,421, Sept. 28. Oil under treatment is passed continuously through a series of pools and alternate pools are heated and cooled. $AlCl_3$ material is introduced into the cooled pools and vapors from the heated pools are removed and condensed. An app. is described.

Cracking and hydrogenating oils, coal, etc. INTERNATIONALE BERGIN-CIE VOOR OLIE EN KOLEN-CHEMIE. Brit. 242,876, April 27, 1925. In the production of benzine, petroleum" and like products by heating coal or heavy oils with H under pressure definite liquid level is maintained in the treatment chamber by taking off the gaseous, d and solid products together at a point between the top and bottom, and by submitting to pressure raw material such as a paste of powd. coal and oil or of liquid hydrocarbon material mixed with an absorbent such as coke, ashes, dolomite, alk. earth oxides and oil shale before it enters the treatment chamber. Cf. *C. A.* **19,** 169.

Cracking hydrocarbon oils. J. F. DONNELLY. Brit. 243,339, Nov. 21, 1924. Oil is heated to a cracking temp. under pressure to prevent vaporization while passing through a heated coil, and on discharge into a region of lower temp. is mixed with cooler oil to prevent decompn. with formation of tar and C. An app. is described.

Cracking hydrocarbon oils. W. F. FARAGHER, W. A. GRUSE and F. H. GARNER. U. S 1,601,730, Oct. 5. A horizontal drum cracking still is externally heated over its lower surface and gases are injected between the walls of the still and baffles spaced from the still walls so as to cause a circulation of the oil and prevent C deposition.

Destructively distilling and gasifying hydrocarbon materials. C. N. FORREST and H. P. HAYDEN. U. S. 1,568,018, Dec. 29, 1925. In effecting distn. and cracking of heavy hydrocarbon material, pieces of inert refractory material such as pumice or fire-brick fragments are used as a carrier and this porous material charged with the substances being treated is passed through a vertical retort where the materials are subjected to distg. temps. Near the exit, the material is subjected to a limited counterflow of air and steam so as to create in the reaction zones a region of combustion and a preceding region of cracking, thus eventually consuming the coke formed from the cracking and restoring the carrier material to clean, uncharged condition.

Decolorizing and stabilizing hydrocarbon oils. P. W. PRUTZMAN. U. S. reissue 16,439, Oct. 12. See original pat. no. 1,547,682, *C. A.* **19,** 3013.

Distilling and converting hydrocarbon oils. J. B. WEAVER. U. S. 1,601,786, Oct. 5. Vaporized oil is heated to above 535° and immediately after conversion in the vapor phase is effected the conversion products are rapidly cooled to a crit. temp. below 315°, above which crit. temp. the cooling will produce a deposit of substantially all the C that will be formed in the cooling. The C is collected for removal and the conversion products are further treated at a temp. sufficiently low that no further C deposition occurs. Fe_2O_3 may be used to assist conversion.

Hydrocarbon product. M. B. HOPKINS. Can. 264,192, Sept. 7, 1926. Hydrocarbon vapor is passed at atm. pressure with air through a temp. zone between 300° and 650° F., the proportion of air is between 5 and 20 cu. ft. per lb. of hydrocarbon. The products are collected and distd. with steam, treated with dil. alk. soln., and washed with water.

Hydrocarbon product. J. SIMPSON. Can. 274,193, Sept. 7, 1926. Petroleum distillates are prepd. by subjecting a naphtha distillate contg. S in corrosive form to the action of a Na plumbite soln. previously used to treat a sour cracked naphtha.

Purifying mineral oils. F. SCHWARZ. Brit. 242,317, May 9, 1924. "Turbine oil" may be mixed at a temp. of 25–30° with 1% of crude naphthenic acid, 1% of a 25% Na benzoate soln. and 1% of a 38° Bé. NaOH soln. and allowed to stand for a day. Generally, mineral oils may be freed from dark-colored substances by treating with soap and alkali, sepg. sludge by centrifuging or otherwise and finally washing with H_2O, salts such as benzoates, acetates, ethylsulfonates, phthalates, *m*- or *p*-aminobenzene sulfonates, α- or β-naphthalenesulfonates or chloride, sulfate or phosphate of Na, K or Mg may be added, and the oils may be preliminarily purified by treatment with reagents such as H_2SO_4 or fuller's earth.

Refining mineral oils with anhydrous antimony pentahalides. T. HELLTHALER. U. S. 1,601,753, Oct. 5. About 5% of $SbCl_5$ may be used with oils such as dark dynamo oil to produce a refined oil of light color.

Distilling petroleum oil. W. F. FARAGHER, W. A. GRUSE and F. H. GARNER. U. S. 1,601,729, Oct. 5. A body of oil in a still is heated externally below the cracking temp. and circulation of oil within the still is effected by upwardly directed gaseous currents such as natural gas which operate on the "air-lift" principle.

Decolorizing petroleum distillates. R. C. POLLOCK. U. S. 1,602,703, Oct. 12. Gasoline is agitated in the presence of 0.025–0.2 lb. of H_2SO_4 and 0.1–2.0 lbs. of clay for each bbl. of gasoline.

Dehydrating petroleum emulsions. H. C. EDDY and G. B. HANSON. U. S. 1,602,190, Oct. 5. A gas contg. a de-emulsifying agent is introduced into a well from which oil is being pumped.

Circulating system for dephlegmating partially cracked petroleum vapors. R. T. POLLOCK. U. S. 1,602,909, Oct. 12.

Distilling volatile substances from shale and similar materials. C. A. SPOTZ. U. S. 1,601,777, Oct. 5. Material to be distd. is passed below the surface of a bath of molten metal and the finer particles of material are then allowed to rise to the surface of the bath and are moved along the surface to be discharged with the spent submerged material. Volatile products are led off from the bath with exclusion of air.

Hydrogenation and production of non-sludging oils. H. R. MOODY. U. S. 1,601,406, Sept. 28. Sludge-forming oil such as a petroleum fraction contg. unsatd. compds. is treated with Al carbide and with $AlCl_3$, at an elevated temp. (usually about 120–150°). The treated oil is suitable for use in *elec. app.*

Tubular retort (with an internal heater) for distilling oil-shale, coal and other carbonaceous materials. J. J. JAKOWSKY. U. S. 1,602,819, Oct. 12.

Separating water from emulsified mineral oils. E. I. DYER and A. R. HEISE. U. S. reissue 15,871, July 15, 1924. See original pat. No. 1,242,784; *C. A.* **12,** 222.

Mineral oil contg. emulsified H_2O is passed under pressure through infusorial earth and the oil and H_2O are then permitted to stratify.

Filtration and sedimentation apparatus for separating oil and water. E. W. GREEN, H. OGDEN and G. R. UNTHANK. Brit. 243,501, Oct. 29, 1924.

Apparatus for gravity separation of oil and water. E. W. GREEN and H. OGDEN. Brit. 243,433, Aug. 26, 1924.

Hydrometer for testing gasoline at supply pumps, etc. T. O. BLAKE. Brit. 242,-770, Oct. 20, 1924. A density scale is provided which is adjustable to accord with temp. variations.

Decanting apparatus for gasoline purification. N. C. RILEY and R. B. GREEN. U. S. 1,602,705, Oct. 12.

Lubricant. P. C. MCKEE. U. S. 1,603,086, Oct. 12. A mixture of acetone 5 gals., celluloid "film scrap" 5 lbs., AmOAc 1/2 pint and graphite 5 lbs. is used on journal bearings, etc. Gold bronze may be added.

Lubricants for engine bearings or other machine parts. R. BIRKBECK, E. BIRKBECK and G. E WEBSTER. Brit 242,520, March 31, 1925. Lubricating oil is mixed with fat, Hg, S and castor oil, a suitable mixt. comprising, *e. g.*, lard 16 lbs., sheep tallow 1 lb , S 40 lbs , Hg 16 lbs and castor oil 24 lbs formed into a creamy compn., 4 oz. of which may then be added to 1 gal. of castor oil or other lubricating oil.

Refining mineral lubricating oil. J. W. WEIR. U. S. 1,603,174, Oct. 12. Lubricating oil stock is treated with H_2SO_4, settled and the major portion of the sludge is removed, then the oil is agitated with an absorbent such as fuller's earth at a temp. below that at which the sludge decomposes to gather the solid suspended sludge, the gathered sludge and absorbent material are then sepd. from the oil, additional absorbent material is added to the oil and the mixt is heated to a temp. sufficient to decompose the remaining sludge and liberate SO_2, and the solids are again sepd. from the oil.

Purifying waste lubricating oils. L. H. CLARK. Brit. 243,666, Nov. 29, 1924. Oils contg decompn. products, free fatty acids and colloidally suspended substances are heated with an aq. reagent such as Na silicate, NaOH, Na_3PO_4 or Na_2CO_3 and centrifuged.

Bituminous emulsions. G. S. HAY. Brit. 243,398, May 31, 1924. Asphalt is melted at a temp of about 102–107°, incorporated with starch or dextrin and a dil. soln. of KOH is added; boiling H_2O is added to bring the emulsion to the desired consistency and the mixt is agitated until emulsification is complete. Similar emulsions may be prepd for road making, as a binder for fuel briquets, for impregnating concrete, roofing or other purposes by the use of up to about 10% of starch or dextrin (which may be partly replaced by fatty acid) or an alkali starch gel as emulsifying agents. Cf. *C. A.* 20, 2067.

Treatment of bituminous substances. G. W. ACHESON. Can. 264,216, Sept. 7, 1926 A reflocculated solid adsorbent material and an acid reagent are caused to react on S-contg. bituminous substances

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

The future trend of cellulose chemistry. G. J. ESSELEN, JR. *Ind. Eng. Chem.* 18, 1031–4(1926). E. J. C.

General study of the chemistry of cellulose and its principal derivatives. P. EHRMANN. *Thesis Strasbourg; Caoutchouc & gutta-percha* 23, 13,030–2, 13,064–5, 13,099–102, 13,138–9, 13,175–6, 13,240–1, 13,275–6(1926).—The subjects treated include the definition of cellulose, its occurrence, properties and formulas proposed for its constitution; hydracelluloses and hydrocelluloses; oxycelluloses; quant. methods for distinguishing modified celluloses; esters and ethers of cellulose; prepn. and properties of nitrocelluloses; cellulose sulfate; cellulose acetates and cellulose xanthates; with 123 references. C. C. DAVIS

Suggested constitutional formula for cellulose. H. LE B. GRAY. *Ind. Eng. Chem* 18, 811(1926) —Based on the empirical formula $[(C_6H_{10}O_5)_x]_y$, where x represents the simple mol. and y the aggregate bound by polymerization, G. proposes a formula consisting of 4 glucose residues, 3 contg. the amylene oxide ring and one the butylene. The OH adjacent to the latter should show different chem. properties than the other 24, confirming Herzog's x-ray analyses and phenomena exhibited by viscose, etc. The formula explains the formation of only 2,3,6-trimethylglucose from cellulose and of cellobiose octaacetate upon acetolysis. C. E. CURRAN

The manufacture of cellulose by means of electrolytic chlorine. C. MATIGNON. *Genie civil* **87,** 552(1925).—A description of the process applied at L'Electrochimica Pomilio at Naples. The alkalies and the Cl produced by the electrolysis of NaCl solns. are used to clean and bleach fiber plants obtained in Tunis and Algeria and enables paper stock to be produced. A market is thus obtained for excess plant intended for the manuf. of Cl during war times. JACK J. HINMAN, JR.

Heat problems in cellulose manufacture. G. SUNDBLAD. *Arch. Warmewirtschaft* **5,** 111–4(1924).—The sulfate and sulfite processes are described, and typical heat balances are given for an old and a modern plant of each type. ERNEST W. THIELE

Can trials in glass apparatus be used in the study of industrial processes? S. SCHMIDT-NIELSEN *Svensk Pappers-Tid.* **29,** 158–61, 186–8(1926).—Investigations of the mechanism of the reactions in the production of cellulose can be studied better and with more reliable results by working with 1-g. portions in glass vessels than by using semi-commercial amts. in technical app As evidence there are submitted 3 graphs and 9 tables of comparative numerical data covering 2 typical examples, the effect of the digesting liquor on the yield and quality of the fiber, and the effect of fillers on paper. W. SEGERBLOM

Investigations relating to the problem of the α-cellulose determination. H. BUBECK. *Papierfabr.* **24,** Festheft, 66–71(1926).—When pulp, mercerized in a 17.5% alkali soln., is dild. to 8–9% (by vol.), the max. amt. is dissolved. The α-cellulose of a pulp is regarded as that portion which, after a mercerization period of 30 min. in a 17% (by wt.) soln. of pure NaOH at 18°, is insol. in 8–9% (by vol) NaOH soln at room temp. (18–22°). A const. mercerization temp. is necessary, since this factor affects the α-cellulose value. Within 12–27° the α-cellulose increases with increasing temp. Brief differences in time are without influence. A 90 min. mercerization of a series of pulps showed a max. difference of only 0.36%, compared with the values obtained by a 30-min. period. J. L. PARSONS

The action of oxygen on alkali cellulose. W. WELTZIEN AND GERHARD. *Papierfabr.* **24,** Tech.-Wiss. Teil, 413–4(1926).—Cotton or artificial silk swollen by NaOH absorbs O in large quantities at ordinary temp. The absorption increases with temp. elevation. Bleached cotton, mercerized with 10% NaOH soln. and pressed until its wt. was approx. 3 times the wt. of the untreated material, was placed in an app. filled with gaseous O and heated in a thermostat to 60°. The rate of absorption was nearly const. even after 41 days; the end-point of the reaction was not detd. J. L. P.

Soluble cellulose esters of the higher fatty acids. H. GAULT AND P. EHRMANN. *Bull. soc. chim.* **39,** 873–83(1926).—The chlorides of lauric, palmitic and stearic acids acting upon hydrocellulose "Girard" in the presence of pyridine and toluene gave, resp., *cellulose laurate, palmitate* and *stearate* as insol. monoesters and at the same time the sol *dilaurate, dipalmitate* and *distearate* of cellulose in soln. The latter esters treated with excess of the acid chlorides gave, resp., *cellulose trilaurate, tripalmitate* and *tristearate* By using nitrocellulose and the acid chlorides, *laurodinitrocellulose* and *palmitodinitrocellulose* were prepd.; cellulose acetate was used instead of nitrocellulose. *Laurodiacetocellulose* and *palmitodiacetocellulose* were obtained similarly. The complete soly. of these esters in aromatic hydrocarbons is a characteristic property. R. C. ROBERTS

The determination of the degree of swelling of cellulose by the Schwalbe hydrolysis-number method. G. BERNARDY. *Z. angew. Chem.* **39,** 259–61(1926).—The Schwalbe hydrolysis no. method for detg. the amt. of swelling has given very unsatisfactory results to several investigators The method is to hydrolyze the finely cut cellulose exactly 15 min. with boiling 5% H_2SO_4, neutralize with 40% NaOH, add Fehling soln., again boil exactly 15 min., collect the Cu_2O, dissolve in HNO_3 and det. electrolytically. B. shows that the errors and variations are due to inexact neutralization of the acid and describes a slight modification of the app. to obviate this. M. A. Y.

Esparto grass. L. PAOLI. *Papierfabr.* **24,** Festheft, 110–1(1926).—Esparto grass cultivation in northern Africa is described and the paper-making qualities of the fiber are discussed. J. L. PARSONS

For the organization of the scientific investigation of plant fibers. C. G. SCHWALBE *Kolloid-Z.* **39,** 178–80(1926).—Fresh fibers are rarely used for examn. No account is taken of the "living age" of fibers or the aging which may have occurred after their death. Both chem. and colloidal changes occur on aging. The Am. Chem. Soc. has a commission to investigate standard cellulose. Only such standard materials should be used in investigation. F. E. BROWN

The aging of plant fibers. C. G. SCHWALBE. *Papierfabr.* **24,** Festheft, 38–41 (1926).—The aging of plant fibers may be divided into 2 periods: the age of the living fiber, and the duration of storage on the fiber after the vitality of the protoplasm has

ceased. Very young fibers are soft, pliant and capable of being highly swollen; old fibers become stiff and brittle. Prolonged drying of pulp wood produces a contraction of the cell membranes and decreases the absorption of the cooking liquor. Wood chips after being stored for 10 years could not be cooked by the sulfite process. Wood which has been deresinified and dehydrated with C_6H_6 is practically incapable of digestion by the sulfite process: the extn. has destroyed the swelling property of the fibers. For this reason fresh wood is preferred to stored wood for mech. pulp. The latter is preferable, however, for steamed mech. pulp. The drier the wood, the more rapid and uniform will be the action of the steam. Aging affects the chem. and phys. reactivity of wood fibers to a much greater degree than fibers free from such incrustations. The oven drying of fibers is more harmful than careful air drying. Fiber durability depends on the quality of the raw material, as well as on other factors, such as sizing, etc. The addn. of hygroscopic substances retards the aging of fibers. J. L. PARSONS

Investigations on the chemistry of the sulfite pulp process. ERIK HÄGGLUND. *Svensk Kem. Tids.* **28,** 177–92; *Papierfabr.* **24,** Tech.-Wiss. Teil, 449–50, 483–8(1926); cf. *C. A.* **20,** 821.—Evidence is given to show that during the early part of the sulfite cooking process the lignin is sulfonated but remains as an insol. compd. By subsequent hydrolysis the greater portion of this compd. is rendered water sol. "Overcooking" is apparently a condition which causes an intramol. change to form an insol. and dark colored compd. In unbleached sulfite pulp, lignin is present as the insol. lignosulfonic acid, to which compd. is attributed the fluorescence effect observed after exposure to ultra-violet light. H-ion concn. in sulfite liquor was detd. satisfactorily by obtaining the reaction const. for the inversion of sucrose soln. and then comparing with reaction data obtained by treating similar sugar solns with HCl solns of known H-ion concns. For Ca, Mg and NH_4 sulfite cooking liquors, the p_H in actual cooking operations increased from 1.9 to 2.0 after 6 hrs , and decreased after 12 hrs., dropping to 1.7–1.8 after 18 hrs. The initial decrease in acidity was due to the moisture in the wood. Expts. with these 3 cooking liquors showed that the free SO_2 increased slightly; the amt. of bisulfite gradually decreased; the loosely fixed SO_2 increased proportionately with the amt. of lignosulfonic acid in soln.; the sugar and pulp yields were about the same. The Cu nos. of the pulp were in general higher at the beginning than at the end of the cook; the Br nos. were identical for the Ca and Mg liquors, but higher for the NH_4 liquor. The properties of the resulting pulps are shown graphically. J. L. P.

The inventor of sulfite pulp. JOHN LUND. *Paper Making* **45,** 313–4(1926).—Brief historical notes on the work carried out at Northfleet by C. D. Ekman on the sulfite process. A. PAPINEAU-COUTURE

Economical use of (waste) sulfite liquor. A. W. ALLEN. *Chem. Met. Eng.* **32,** 928–31(1925).—The application of the Peebles evaporator to waste sulfite liquor and use of the concd. liquor for boiler fuel is described. C. E. CURRAN

Modern control system in producing sulfate pulp. O. HEIJNE. *Svensk Pappers-Tid* **29,** 249–57(1926) —Comparison of American and Scandinavian sulfate pulping practice with data relative to methods of control. W. SEGERBLOM

Modern control system in producing sulfate pulp. E. OMAN. *Svensk Pappers-Tid.* **29,** 286(1926).—E., referring to the paper by Heijne (preceding abstr.) points out that methyl orange is an unsuitable indicator because of its indistinct color change and small sensitivity, also that phenolphthalein is unsuitable due to the presence of Na_2S in the soln. E. considers the use of both indicators in the same soln. as of doubtful value. He also objects to pptg. the carbonate without filtering off the $BaCO_3$. He recommends Nile blue (sulfate) for NaOH and Na_2S, thymol blue for NaOH, Na_2S, and Na_2CO_3, and bromophenol blue for NaOH, Na_2S, Na_2CO_3 and Na_2SO_4. W. S.

Modern control system in producing sulfate pulp. O. HEIJNE. *Svensk Pappers-Tid.* **29,** 340(1926).—Answering Oman's criticism (preceding abstr.) H. does not deny that the indicators suggested by O. give more accurate results but contends that methyl orange and phenolphthalein are widely used in the sulfate pulp industry and that it is better to employ generally adopted and widely used methods giving approx. results than to use a more accurate analytical method which few employ. W. SEGERBLOM

A semi-chemical pulping process. J. D. RUE, S. D. WELLS, F. G. RAWLING AND J. A. STAIDL. *Paper Mill* **49,** No. 38, 10, 12, 39–40(1926); *Paper Trade J.* **83,** No. 13, 50–3(1926); *Pulp Paper Mag. Can.* **24,** 1163–7(1926).—The process consists essentially in: (1) a pressure impregnation of the chips with the cooking liquor; (2) a mild digestion of chips with chemicals which are practically neutral and which are capable of maintaining neutrality during the liberation from the wood of considerable quantities of org acids (preferably a soln. contg. about 10 lbs. Na_2SO_3 and 4 lbs. $NaHCO_3$, calcd. as Na_2CO_3, per 100 lbs. of wood); (3) a mech. reduction of the softened chips to pulp, prefer-

ably in a rod mill. Cooking data and strength data of the papers produced are tabulated for hardwood pulps designed for print papers, hardwood pulps designed for boards, and coniferous pulps. Coniferous woods yield readily to the treatment, but the pulp does not possess strength and flexibility commensurate with the length of the fibers and it is not considered the process would be economically or technically advantageous for the reduction of these woods. The pulps obtained from deciduous woods possess much greater strength and flexibility than soda pulps from the same woods. Paper of the wt. and caliber of news print made wholly from semi-chem. pulp of black, tupelo, or red gum, or aspen, birch or maple possesses greater strength than the present com. news print. With addn. of clay excellent catalog paper can be made. The process is suitable for the manuf. of board pulp, and in such case the wood requires much less care ful prepn. than for print paper. Production of board from extd. chestnut chips by the semi-chem. process has satisfactorily passed into the com. stage of manuf. The economic advantages of the process are discussed. A. PAPINEAU-COUTURE

The hardness of sulfite pulp. D. A. CAMERON AND M. W. PHELPS. *Pulp Paper Mag. Can.* **24,** 1170 2(1926).—Residual lignin plays an important part in detg. the quality of sulfite fiber. This lignin is readily approximated with sufficient accuracy for works control by the use of a $KMnO_4$ test (see Cadigan, *C. A.* **18,** 1905), which could be applied for controlling the time of blowing the cook to obtain the desired "hardness" of pulp. Com. pulps have a hardness no. of 10–20 and a lignin content of 3–5%. Future cooking methods may be developed to eliminate less lignin, increasing residual lignin to over 10% and giving yields of 55–65%. Hardness tests would facilitate the detn of the exact blowing time that such cooking conditions would require. A. P.-C.

Sulfite pulp and its uses. HAROLD HIBBERT. *Dyer & Calico Printer* **56,** 29(1926).—A chart showing the uses of wood pulp. CHAS. E. MULLIN

Freeness of sulfite pulp. D. S. DAVIS. *Ind. Eng Chem.* **18,** 631–3(1926).—Using a Williams freeness tester, D has developed a method for duplicating orifice settings and converting values obtained with one orifice in terms of another. Charts are also given for converting freeness values from one consistency to another and adapting the Williams app. to detn. of additive freeness C. E. CURRAN

The fluorescence of sulfite pulps. C. WALTER LEUPOLD. *Papierfabr.* **24,** Tech.-Wiss. Teil, 397–8(1926).—The fluorescence of waste sulfite liquor or sulfite pulp under the action of sunlight, or other light sources rich in ultra-violet rays, is attributed not to lignin decompn. products, but rather is an optical phenomenon due to S compds. which are diffused as lipoid-insol. substances in the fiber cells. J. L. PARSONS

The violet fluorescence of sulfite pulp and waste sulfite liquors. OTTO GERNGROSS AND KINGNOR TSOU. *Papierfabr.* **24,** Tech.-Wiss. Teil, 497–9(1926).—The results of Kirmreuther, Schlumberger and Nippe (cf. *C. A.* **20,** 2746) on the violet fluorescence of waste sulfite liquors have been confirmed. The cause of this phenomenon is not due to a lignosulfonic acid or to any compd. produced during the digestion process, but is attributed to a natural substance in the spruce bark and wood, where it is more firmly combined. The latter is responsible for the fluorescence of unbleached sulfite pulps. J. L. PARSONS

The influence of a shortened preliminary cooking time on the nature of sulfite pulp. O. ROUTALA AND J. SEVÓN. *Zellstoff u. Papier* **6,** 257–9(1926).—Results of cooking expts. when the temp. and pressure are brought to 100° and 4 atm. within the first hr. of the digestion process indicate that the resulting sulfite pulp has not been changed. The reason for the lack of uniformity during the cooking process is not entirely due to imperfect penetration of the wood by the liquor before 100° is reached, but more often to a too rapid increase of the temp. from 100° to 130–140°, during which period the incrustations dissolve most rapidly. J. L. PARSONS

The possibility of utilizing Finnish sulfite waste liquor by means of yeast organisms. VÄINO KROHN. *Ann. Acad. Sci. Fennicae A.* **23,** No. 8, 3–147(1926).—Increased alc. yields are possible from sulfite waste liquor by proper prepn. of the liquor and cultivation of strains of yeast organisms resistant to the modified liquor, together with careful control of the fermentation process. Sulfite waste liquor contains yeast-poisoning materials (SO_2, formic acid, etc.), but the carbohydrate content is high. K, Mg, Ca and SO_4 are present in considerable amts. N and PO_4 are practically absent. A suitable nutrient medium can be secured from the waste liquor either (1) by removal of the injurious components through boiling, aeration and neutralization with lime, or boiling with sawdust, addn. of $CaCO_3$, and aeration to attain the proper acidity, or (2) by addn. of suitable nutrients to the liquor. In either case objective cultivation of yeasts adapted to such media is required as neither wild nor cultivated forms will work satisfactorily until after such adaptation. To obtain the best results with trained yeasts such factors

as the acidity, temp., N source, addn. of O, balance of nutrients, etc., must be very carefully controlled. LOUIS E. FLECK

Indicators for the pulp industry. E. OMAN. *Svensk Pappers-Tid.* Nos. 9–11 (1925); *Papierfabr.* **24**, Tech.-Wiss. Teil, 267–70, 285–8, 299–303(1926).—Cf. *C. A.* **19**, 2743. J. L. PARSONS

The control of stock concentration. H. SCHWALBE. *Wochbl. Papierfabr.* **57**, Sondernummer, 70–2(1926).—The Herdey centrifugal method of detg. stock concn. is modified by using 100-cc. glass containers in the centrifuge, filling to the 80-cc. mark with stock and the remaining 20 cc. with "glanz" oil (contg. 50% Turkey red oil), which acts as an antifoam agent. The glasses are whirled for 4 min. at 2000 revolutions per min. The height of the pulp residue is a measure of the stock concn. J. L. P.

The phloroglucinol reaction with incompletely cooked sulfite pulp. KORN. *Papierfabr.* **24**, Tech.-Wiss. Teil, 521–2(1926).—The following conclusions are drawn as a result of many tests on different sulfite pulps with phloroglucinol reagent: (1) the degree of lignification can be estd macroscopically in small samples, both in the original condition and after a 15 min. treatment with 1% NaOH soln., when treated with phloroglucinol and HCl. The greater the difference in the red coloration, the less has the pulp been cooked. (2) In the testing of paper for groundwood with phloroglucinol, the appearance of an intense red color may be due to incompletely digested pulp, even if the sample has been previously treated with NaOH, or hot water; a microscopic test will indicate with certainty the presence of groundwood. J. L. PARSONS

The bleaching of sulfite pulp. L. RYS. *Papierfabr.* **24**, Tech.-Wiss. Teil, 529–33 (1926).—During the bleaching of sulfite pulp with hypochlorite solns. a chlorination occurs and the final reaction products are sol. Whether chlorination occurs during the initial bleaching stage was not detd. Under otherwise similar conditions, the amt. of org fixed Cl increases with the lignin content of the bleached pulp. Expts. showed that the equation $2NaOH + Cl_2 \rightleftharpoons NaClO + NaCl + H_2O$ is reversible, and that chlorination was characterized by a displacement of the equil. to the left, and oxidation to the right. It is probable that the bleach soln. tends to become neutral during the reaction. The pulp color was inferior in the presence of Cl_2 or chlorides. Resinification of the lignin occurs with intense chlorination without oxidation. J. L. PARSONS

Developments in the bleaching of pulps. H. WENZL. *Wochbl. Papierfabr.* **57**, 955–60(1926).—High density bleaching devices are discussed, with especial reference to the Wolf and Thorne systems. A patented process is briefly described which consists in increasing the production of the older type bleachers by chem. means and thereby economizing on power, steam and time. It may be made a continuous system. Comparative bleaching tests, with and without the addn. of "Greloxin" to the usual bleach bath at 38°, showed that the time can be reduced from 10 to 2 hrs. At 23° the time was about 4 hrs. when "Greloxin" was added. The quality of the pulp bleached by the accelerated process was superior: the Cu no. was 50% lower than that of pulp bleached by the usual procedure. J. L. PARSONS

The Thorne pulp-bleaching process. JULIUS FUNCKE. *Papier* **29**, 533–7(1926); *Paper Trade J.* **83**, No. 3, 49–51(1926); *Paper Ind.* **8**, 1001–2(1926).—See *C. A.* **20**, 2748. A. PAPINEAU-COUTURE

High density bleaching. HANS WREDE. *Paper Maker and Brit. Paper Trade J.* **Annual No.,** 57(1926).—Brief discussion of the merits of the Wolf high-d. bleacher. A. PAPINEAU-COUTURE

Bleaching apparatus and the bleaching of pulp at high stock concentrations. HANS WREDE. *Papierfabr.* **24**, Tech.-Wiss. Teil, 421–7(1926); *Wochbl. Papierfabr.* **57**, 903–9 (1926).—High-density bleaching of pulp is briefly discussed. The different types of Wolf high-density bleachers, as manufactured by Voith, are described. J. L. P.

A rapid tester for the available chlorine in hypochlorite solutions and chlorine bleach baths. H. WENZL. *Papierfabr.* **24**, Tech.-Wiss. Teil, 406–7(1926).—A portable, rapid volumetric tester is described for detg. the available Cl in bleach solns. by the addn. of H_2O_2. J. L. PARSONS

Whiteness measurements on bleached pulp samples. H. WENZL. *Papierfabr.* **24**, Tech.-Wiss. Teil, 409–10(1926).—In the detn. of the whiteness content of bleached pulps by the Ostwald penumbral photometer, the following rules should be observed: (1) Only air-dry samples should be employed. (2) The wt. of the pulp must be over 400 g per sq. m., thinner samples are translucent. (3) The pulp must have a smooth surface, as felt marks affect the accuracy of the readings. Highly compressed pulps should be moistened, smoothed and carefully dried before placing in the photometer. In the estn of whiteness, a sepn. of the yellow and red shadings is necessary, and for this

purpose 3 color filters, which are standardized spectroscopically and possess a definite absorption spectrum, should be used. J. L. Parsons

A new Swedish discovery in the sulfate industry. C. G. Schwalbe. *Papierfabr.* **24,** Tech.-Wiss. Teil, 515-6(1926).—A discussion of the Nordstrom process for the utilization and the deodorizing of waste gases from sulfate pulp mills. J. L. P.

Soda pulp investigations. I. Yield and quality of pulp as affected by length of chip. D. E. Cable, R. H. McKee and R. H. Simmons. *Paper Trade J.* **83,** No. 14, 47-9(1926); cf. *C. A.* **20,** 1517.—With chips varying in length with the grain from 0.5 to 1.25 in., no appreciable differences in yield, bleach consumption or loss on bleaching could be detected in the case of aspen, white birch, white maple and silver maple This apparently holds regardless of whether the total duration of a cook is that commonly used in mill practice or only slightly longer than the min. time possible for achieving full pulping action on the chips. The av. yields of soda pulp under standard conditions for aspen, white birch and white maple were 48.2, 46.4 and 45.0%, resp., equiv. to 1176, 1895 and 2051 lbs. per cord, resp., showing that these hardwoods give 55 to 75% higher yields than aspen on a cord basis Silver maple cooked 4.5 hrs. appears to give the same yield as when cooked 6 hrs , yields in either case being approx. the same on percentage basis as yields from white maple cooked for 6.5-7 hrs. The bleach (calcd. to 35% available Cl) requirement and loss on bleaching for the pulps studied averaged: aspen 8.3, 1.5; white birch 12.9, 2.3; white maple 13.5, 2.6; silver maple 13.3, 2.2%, resp. A Papineau-Couture

The cooking of pine wood by the sulfite process. C. G. Schwalbe and Kurt Berndt. *Wochbl. Papierfabr.* **57,** Sondernummer, 27-37(1926).—Pine wood cooked by the sulfite process; with Ca or Mg bisulfite cooking liquors, gives a hard, brittle, brownish red pulp. During the digestion period (10 hrs) the pressure rapidly increased to a max. of 5 atm at 133-134°. When org solvents, such as C_6H_6 and Et_2O, are employed to remove the fats and resins in a preliminary extn. of pine wood it is not possible to produce a satisfactory pulp under the usual cooking conditions. By extending the time a good pulp might be obtained. An alk. pretreatment of pine wood, with dil. solns. of either NaOH or Na_2CO_3, gave a 55% yield of a very hard pulp contg. a relatively large amt. of incrustations. The fibers were not as brittle as with the solvent-extd. wood. Preliminary treatments with alkali and then C_6H_6 yielded a poor pulp. Treatment of pine wood with C_6H_6 profoundly affects the properties of the raw material. Pretreatment with 1% AcOH yielded a carbonized pulp. The digestion of the heartwood by the acid process remains an unsolved problem It is not known with certainty that the higher resin and fat content is the real difficulty. J. L. Parsons

The fiber length of sulfite pulps. E. Richter. *Wochbl. Papierfabr.* **57,** 798-9 (1926).—The detn. of fiber length is a valuable test for evaluating the quality of a sulfite pulp. Microscopical detns of the av. length of incompletely cooked fibers amounted to 2.31-2.51 mm., depending on the nature of the wood and pulp. The av. length of all fibers was 1.26-1.72 mm. Fiber length is influenced by the digestion process, but does not vary greatly with the lignin content of the pulp nor the moisture in the wood. J. L. Parsons

Calculation of the water consumption for a sulfite and wrapping-paper mill. A. St. Klein. *Wochbl. Papierfabr.* **57,** Sondernummer, 56(1926).—For a mill producing 35 kg. sulfite pulp and 7 kg. paper per min., the av. water consumption is calcd. to be 12,000 l. per min. J. L. Parsons

The rod mill in the pulp and paper industry. J. D. Rue and S. D. Wells. *Paper Trade J.* **83,** No. 12, 53-4(1926); *Paper Mill* **49,** No. 38, 14, 16(1926).—Expts. conducted for 2 yrs. on a semi-com. rod mill (3 ft. internal diam. by 5 ft. long, charged with 3800 lbs. of steel rods) have proved it to be an excellent means of reducing to fiber wood chips, cereal straw and flax straw, after the material has been softened by mild chem. treatment; it has also been used successfully in reducing knots and screenings resulting from the chem. pulping processes. In can also serve as a continuous beater which effects hydration without excessive rupture of the fibers. A. Papineau-Couture

Italian celluloid industry. Vittore Ravizza. *Giorn. chim. ind. applicata* **7,** 576-80 (1926).—Descriptive, with a number of photographs. Robert S. Posmontier

Rapid analysis of raw materials used in the manufacture of celluloid. Bellanger. *Rev. gén. mat. plastiques* **2,** 368-72(1926).—Brief outline of the testing of cellulose (both cotton and paper), acids, camphor, alc., celluloid waste, camphor substitutes, plastifiers, urea and solvents, from the standpoint of the requirements for celluloid manuf. A. Papineau-Couture

Cellophane. Anon. *Wochbl. Papierfabr.* **57,** 998-9(1926).—Brief description of the mfg. process. J. L. Parsons

International pulp and paper statistics. H. G. HAGSTRÖM. *Svensk Pappers-Tid.* **29,** 279–80(1926).—Continuation of the data given in *C. A.* **17,** 3787; **18,** 2427.
W. SEGERBLOM

Recent developments in pulp and paper manufacture in America. WALTER BRECHT. *Wochbl. Papierfabr.* **57,** 584–8, 707–9, 827–9, 909–11, 961–3(1926).—The conclusion of a series of articles on American practice in pulp manuf., beating, process control, bleaching and stock regulators.
J. L. PARSONS

Woods from Nigeria as paper-making materials. ANON. *Bull. Imp. Inst* **24,** 8–14(1926).—Analyses of (1) Abura (*Mitragyna macrophylla*), (2) Afara (*Terminalia superba*), (3) Oro (*Irvingia barteri*), (4) Arere (*Triplochiton nigericum*) and Ogia (*Daniella ogea*) (two planks of somewhat different appearance and analyzed separately) are given together with the results of pulping tests. In every case bleaching was difficult, required a large bleach consumption and did not give a very good white. A. P.-C.

Paper-making qualities of water-hyacinth (Eichhornia crassipes). L. VIDAL AND M. ARIBERT. *Agronomie coloniale* **13,** 252(1925); *Bull. Imp. Inst.* **24,** 267–8(1926).—"Luc-Binh" leaves from Indo-China contained H_2O 5, ash 5, cellulose (on dry basis) 32%. The pulp obtained by digestion with NaOH consists of flat, transparent, thin-walled fibers, 2–3 mm. long, and 0.012–0.030 mm. in diam. Pulping with CaO gave 35% of unbleachable pulp which could be converted into brown wrapping paper of fair quality, but the yield is only about half that given by straw. Digestion with NaOH gave 27% of pulp which could be bleached only with difficulty; and the paper obtained from this pulp is lacking in strength and of inferior quality. A. PAPINEAU-COUTURE

Bamboos from Malaya for paper making. ANON. *Bull. Imp. Inst.* **24,** 219–21 (1926).—Samples of "Buloh Plang" (probably *Gigantachloa wrayi,* Gamble) and of "Buloh Kasap" (*Ochlandra ridleyi,* Gamble) had: H_2O 11.1, 9.8; ash 3.5, 4.2; cellulose (on dry basis) 56.25, 55.1%; ultimate fiber length, max. 3.6, 4.2, min. 1.4, 1.0, av. 2.4, 2.3 mm., resp. On cooking 7 hrs. at 160° with 20 parts NaOH at a concn. of 4%, the two samples gave 41 and 39% of well-reduced unbleached pulp, with consumptions of 11.5 and 11.9% NaOH, on the wt. of stems used, and the corresponding yields of bleached pulp were 36 and 35%. The pulp from Buloh Plang furnished a strong light-brown paper; it bleached fairly readily to a pale-cream color and the bleached pulp yielded an opaque paper of good strength and quality. Buloh Kasap pulp furnished a strong, rather paler paper; it bleached readily, yielding a white opaque paper of good strength and quality. Both materials are considered suitable for the com. production of high-quality pulp. A. PAPINEAU-COUTURE

Doum palm (Hyphaene thebaica, Mart.) (as a paper-making material). F. HEIM DE BALSAC, M. CERCELET, J. MAHEU, G. S. DAGAND AND R. HEIM DE BALSAC. *Bull. agence gén. colonies* **18,** 1038(1925); *Bull. Imp. Inst.* **24,** 264–5(1926).—Paper-making tests were made with the wood and with the leaf (both petiole and lamina) of palms from the Goundam and Issa-ber districts of the French Soudan. Analysis calcd. to the dry basis of the wood (H_2O 11.09%) and of the lamina (H_2O 10.75%) gave: ash 1.21, 17.63; fats and waxes 1.05, 0.76; cellulose 48.80, 27.70; lignin 48.94, 53.91%, resp. On digestion with NaOH under pressure, the wood furnished a dark-brown pulp and the leaves (petioles and lamina) a pulp of lighter tint, both of which bleached fairly easily with 35 and 27% yields, resp., expressed on the dry raw material. The pulp in each case was composed of cylindrical, regularly tapering fibers, with a lumen of variable size. The wood fibers were 0.8–1.5 mm. long, av. 1.0, and had a diam. of 0.025–0.045 mm., av. 0.030. The leaf fibers were 0.8–2.0 mm. long, av. 1.5, and had a diam. of 0.010–0.025 mm., av. 0.015. The paper made from the pulp obtained from the wood was of inferior quality, while that from the leaves was of good quality, but the yield in the latter case was low. A. PAPINEAU-COUTURE

"Matsia" grass (Sporobolus pyramidalis, Beauv.) (as a paper-making material). F. HEIM DE BALSAC, M. CERCELET, J. MAHEU, G. S. DAGAND AND R. HEIM DE B[illegible] *Bull. agence gén. colonies* **18,** 1244(1925); [illegible]
; from Mada[illegible]

Madagascar palms (as paper-making materials). F. Heim de Balsac, M. Chercelet, J. Maheu, G. S. Dagand and R. Heim de Balsac. *Bull. agence gén. colonies* **19,** 23(1926); *Bull. Imp. Inst.* **24,** 266–7(1926).—Sep. investigation of the stem, petiole and lamina of "Satrabe" (*Medemia nobilis,* Hild. and W. Drude) and of "Satramira" (*Hyphaene Schatan,* Boj.) gave the following results (analytical results are on dry basis, except H_2O; pulping was carried out with NaOH soln. under pressure, but the cooking conditions are not specified):

	Satrabe			Satramira		
	Stem	Petiole	Lamina	Stem	Petiole	Lamina
H_2O %	7 84	9 36	9 05	8 19	10 23	9 42

Yield of bleached pulp %	31	26	22	29	28	22

The pulp from Satrabe stem furnished a paper of inferior quality which could be used only as a filler; the two parts of the leaf gave papers of good quality and, in spite of the low yield, would be of definite interest for paper making. Each of the 3 parts of Satramira gave a pulp which furnished paper of an av. quality; the yield is rather low in the case of the lamina, but the whole plant would be of interest as a raw material for paper making. A. Papineau-Couture

Banana paper. T. Reifegerste. *Wochbl. Papierfabr.* **57,** Sondernummer, 73–5 (1926).—Paper made from waste from the banana tree (*Musa sapientum* L.), such as leaves and stems, is very strong and is more or less impervious to water without a sizing treatment. The sheet is dark brown in color and is used as a substitute for kraft paper. The use of 2% Na_2CO_3 instead of 5% NaOH in the digestion process gives a less pure pulp but a higher yield. Bleaching is done with a 5% $Ca(OCl)_2$ soln., calcd. on the wt. of the pulp. Cost figures for the process are tabulated. J. L. Parsons

India paper. James Scott. *Paper Maker & Brit. Paper Trade J.* **Annual No.,** 65–71(1926); *Pulp Paper Mag Can.* **24,** 1061–4(1926).—Description of its origin, history and compn. A. Papineau-Couture

Anti-falsification paper. James Scott. *Paper Maker & Brit. Paper Trade J.* **Annual No.,** 75–7(1926).—Various formulas are given suitable for making so-called safety papers, which immediately show up any attempt to tamper with what has been written or printed on documents. A. Papineau-Couture

Parchment paper and its manufacture. Maurice de Keghel. *Paper Trade J.* **83,** No. 10, 57–62(1926).—See *C. A.* **20,** 1519. A. Papineau-Couture

Preparation of electric insulating materials from hardened impregnated papers. L. Bouvier. *Rev. gén. mat. plastiques* **2,** 383–7(1926); *Paper Trade J.* **83,** No. 9, 51–4 (1926).—See Micksch, *C. A.* **20,** 289. A. Papineau-Couture

Coated paper. M. L. Griffin. *Paper Mill* **49,** No. 36, 2, 43–8; No. 37, 2, 10–20, 38–40(1926).—A detailed discussion of the properties and use of the various raw materials used and of the method of carrying out the coating operation. A. P.-C.

The chemical pretreatment of industrial water. Drechsler. *Papierfabr.* **24,** Tech.-Wiss. Teil, 309–10(1926).—The chem. treatment of water with $Al_2(SO_4)_3$ is described, with especial reference to paper manuf. J. L. Parsons

Asbestine. H. Postl. *Papierfabr.* **24,** Tech.-Wiss. Teil, 398–402(1926).—The mining, refining and applications of *asbestos* and asbestine in the paper industry are discussed. J. L. Parsons

Developments in straw board manufacture. F. J. J. Driesens. *Wochbl. Papierfabr.* **57,** 681–4, 736–9(1926).—A general discussion. J. L. Parsons

Modernizing a boxboard mill. H. G. Ingraham. *Chem. Met. Eng.* **32,** 782–7 (1925).—Descriptive of the boxboard mill of the National Paper Products Co., Stockton, Cal. C. E. Curran

Recent results on the strength determination of paper pulps. HELLMUTH SCHWALBE. *Papierfabr.* **24,** Tech.-Wiss. Teil, 465–8, 481–3(1926).—Chiefly a discussion of the results of Ruhlemann, Cameron, Miller, von Posanner and others on the strength detn. of pulps. A list of 21 references is appended. J. L. PARSONS

The bursting strength tester. KARL FENCHEL. *Papierfabr.* **24,** Tech.-Wiss. Teil, 294–5(1926).—To obtain comparative values for the bursting strength of papers of different wts., F. calcs. the strength, using the Mullen tester, referred to a basis wt. of 100 g. per sq. m. These figures are "relative" in comparison to the "abs." ones given directly by the tester. In the operation of the Mullen tester, the glycerol must extend to the rubber membrane, otherwise high values will result. The membrane stretches on use, and should be renewed every 2 months. J. L. PARSONS

Determination of the degree of sizing of paper. U. ALBRECHT. *Pappers-Och Travarutidskrift for Finland,* May 31, **1925;** *Pulp Paper Mag. Can.* **24,** 1065(1926).—The device consists essentially of 2 glass bulbs connected by means of a large tube and arranged so as to rotate about a horizontal axis. One of the bulbs is provided with an orifice from which a large glass tube leads into the interior of the bulb. Before a test is made the latter bulb is upwards, and the lower bulb is partially filled with ink. The test sheet is clamped over the orifice, the app. is rotated through 180°, and the time taken for penetration of the ink through the paper is noted with a stop watch, the paper being observed by means of a mirror under the bulbs A PAPINEAU-COUTURE

The filling and sizing of paper. H. ROSCHIER. *Papierfabr.* **24,** Tech.-Wiss. Teil, 348–50, 363–5, 384–8(1926).—Recent theories concerning the use of fillers and sizing agents in paper are reviewed. Tests show that paper fillers are retained partly mechanically by filtration and partly as a result of the pptn. of the rosin and $Al(OH)_3$. H-ion concn. has considerable influence on filler retention, which is rapidly increased as the p_H is varied from 4 to 5.6. The retention is const. from 5.6 to 7. Adsorption phenomena play a secondary role with fillers. Retention, with both unsized and sized papers, increases with the increase in particle size. The necessity for standardizing fillers according to their degree of dispersions is emphasized. J. L. PARSONS

Aluminum resinate in the rosin sizing of paper. E. OMAN. *Papierfabr.* **24,** Tech. Wiss. Teil, 410–3, 451–5(1926).—A portion of the literature on the rosin sizing of paper is reviewed. The Al in the sizing bath acts as a mordant for the free rosin. The acid no. of rosin (g. NaOH required by 100 g. rosin) usually is 11–12. Al resinate was prepd. by adding K alum in excess to a clear soln. of rosin in NaOH. The ppt. was washed and dried at room temp Its ash content was 4.76%. The ppt was sol. in Et_2O, C_6H_6, CCl_4, but not in Et_2O-EtOH. The prepn probably was a basic Al resinate mixed with free rosin acids. On heating, the air-dried material became darker as the temp. increased, and the % of free rosin acids in the Et_2O ext. decreased. J. L. PARSONS

The influence of glue top-sizing on the properties of rosin and starch-sized papers. E MUNDS *Wochbl. Papierfabr.* **57,** 883–7(1926) —The properties of paper, previously sized with rosin and starch, are enhanced by a surface sizing with glue. Strength tests, such as the stretch, bursting strength and folding endurance, are increased. Thickness, substance wt. and transparency are increased also. The apparent and actual sp. gr. and the porosity show no differences. The sizing resistance is greater. J. L. P.

The Eastman colorimeter. WALTER BRECHT. *Papierfabr.* **24,** Festheft, 72–86 (1926) —American methods for measuring the color of paper are reviewed. A description of the construction and operation of the Eastman colorimeter is given, with especial reference to its use in the detn. of the color of paper. Data are tabulated covering the analysis of 10 papers. Other possible applications of the instrument in the paper industry are: (1) numerical detn. of the two-sidedness of paper, (2) relation between paper two-sidedness and color of the waste water, (3) detn. of the whiteness of pulps, and (4) detg. numerical values for paper fading. Cf. *C. A.* **20,** 2071. J. L. P.

Calculations relating to the strength of plane container walls with special reference to steam receptacles in so-called digesters of both ingot and cast iron. F. VON ZEIPEL. *Svensk Pappers-Tid.* **29,** 189–91, 222–4, 280–3, 314–5, 338–40(1926).—Data are given for calcg. allowable stresses for cast iron digesters. W. SEGERBLOM

De-inking and washing waste paper stock. J. J. O'CONNOR. *Paper Mill* **49,** No 40, 10, 12(1926).—Practical indications based on observations over the course of 5 yrs.' personal experience, with an outline of the procedure at present in use at the plant of the Mead Pulp and Paper Co. A 2,300-lb. batch of stock is agitated for 30–100 min. with a hot soln. of 90 lbs. of NaOH in 3,500 gal. of water. It is then circulated 20–40 min. in the defibering unit, consisting of a conical-shaped tank with a centrifugal pump connected to the apex, the discharge line from the pump being piped back into the lower section of the tank which gives a volcanic effect to the stock when operating. Before

screening, the hot stock (temp. 180° F.) is dild. with H_2O to a consistency of 0.7%, for which purpose fresh water is preferable to clarified water. This effect is attributed to the lower p_H of the clarified water which reduces the p_H of the mixt. and prevents as good a sepn. of the ink from the fibers. A. PAPINEAU-COUTURE

The regeneration of old printing paper. H. WENZL. *Wochbl. Papierfabr.* **57,** Sondernummer, 65–70(1926).—Essentially a review of the patent literature, under the following headings: (1) alk. and mech. treatments of printed paper, (2) use of oxidizing agents, and (3) use of emulsifying agents. J. L. PARSONS

Production control in the newsprint industry. G. D. BEARCE. *Mech. Eng.* **48,** 48–52(1926).—Descriptive. C. E. CURRAN

Metallographic studies on corrosion in the pulp and paper industry and wood grinders (LINDT) **9.** The structure of solid colloids (DUCLAUX) **2.** Apparatus for melting and casting celluloid (Brit. pat. 243,514) **1.**

Half stuffs and cellulosic materials. R. RUNKEL. U. S. 1,602,253, Oct. 5. Peat and various vegetable fibers are preliminarily treated at least partially to free the fibers from colloidal constituents, *e. g.*, by heating or freezing, and the fibers are alternately treated with alk. baths and with Cl while vigorously stirring at room temp. Cf. *C. A.* **20,** 111.

Cellulose films. J. E. BRANDENBERGER. U. S. 1,601,289, Sept. 28. A soln. of Na cellulose xanthate is coagulated and transformed into cellulose and then desulfurized by washing with a 0.5% NaOH soln. in H_2O.

Composite celluloid sheets. H. J. HANDS. Brit. 243,032, May 17, 1924. Sheets of cellulose derivs. other than nitrocellulose are enclosed between thinner sheets of celluloid or the like to produce a harder surface and to retain volatile plasticizing agents.

Polishing celluloid. M. B. MOORE. Brit. 243,397, May 27, 1924. See U. S. 1,589,813 (*C. A.* **20,** 3085).

Pulp high in resistant cellulose. G. A. RICHTER. U. S. 1,602,553, Oct. 12. Sulfite pulp is treated with alk. black liquor resulting from the alk. digestion of wood, to produce a pulp rich in α-cellulose. Cf. *C. A.* **20,** 3568, 3569.

Pulp. G. A. RICHTER. Can. 264,292, Sept. 14, 1926. Wood is digested first in an acid sulfite liquor under heat and pressure, and then further digested by addn to the mass of sufficient alkali in excess to maintain the alky. of the mass; this causes the soln. of the less resistant cellulose. Cf. *C. A.* **20,** 3568, 3569.

Pulp and paper manufacture. L. BRADLEY and E. P. MCKEEFE. Can. 268,181, Aug. 3, 1926. Wood pulp is produced by cooking wood under pressure and at an elevated temp. with an alk. sulfite cooking liquor contg. a high concn. of alk. sulfite and an amt. of H_2SO_3 or sulfite radical greater than that corresponding to the normal sulfite and less than that corresponding to the acid sulfite.

Paper-making machine. J. A. DEVINE. Brit. 243,637, June 27, 1925.

Paper-making apparatus. H. G. CRAM. U. S. 1,601,387, Sept. 28.

Paper-making apparatus. S. C. WENTZ. U. S. 1,603,226, Oct. 12.

Paper-making apparatus. ST. ANNE'S BOARD MILL CO., LTD. AND R. B. HEYS. Brit. 242,864, March 25, 1925.

Paper-making apparatus. J. T. MURPHY. U. S. 1,602,545, Oct. 12.

Suction-roll for paper-making machines. E. E. BERRY. U. S. 1,602,875, Oct. 12.

Removing ink from paper. O. WELSH. U. S. 1,601,193, Sept. 28. Paper is treated with a sapong. agent such as Na_2CO_3 and Na silicate in the presence of rosin or other suitable resinous compd. to remove printers' ink.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

Additions, removals and changes in permissible list of explosives from January 1, 1925 to July 31, 1926. G. ST. J. PERROTT. *Repts. of Investigations, Bur. of Mines,* Serial No. 2770, 3 pp.(1926). CHARLES E. MUNROE

Explosions in compressed-air outfits. F. RITTER. *Z. Ver. deut. Ing.* **70,** 543–4 (1926).—The small quantity of fine oil mist in compressed-air pipes, receivers, etc., when ignited by an elec. spark due to expansion through an orifice, or by adiabatic compression, can cause explosions. No means of protection against ignition by the shock wave of the oil-satd. Fe oxides collecting at certain points has been found. E. M. S.

Firedamp explosions; the projection of flame. M. J. BURGESS. Safety in Mines Research Bd., *Paper* No. **27**, 14 pp.(1926).—The investigation was made by means of glass tubes, one, called the "explosion-tube," closed at one end and connected to a 2d tube, called the "extension-tube" and open at both ends, by means of a brass ring carrying a shutter. The explosion-tube was provided with electrodes to produce the igniting spark. The distance of projection of flame from firedamp explosions, initiated from the closed ends of tubes 5.5 and 9 cm. diam., was detd. under different conditions as regards (*a*) the length of the column of explosive mixt., (*b*) the size of the aperture between the explosion-tube and the extension-tube and (*c*) the character of the atm. in the explosion tube. The projection of flame into air in an unconstricted tube is between 5 and 6 times the length of the original column of explosive mixt., mixts. richer in CH_4 giving a longer injection than weak mixts. of corresponding explosive power, in consequence of the subsequent combustion of the excess of CH_4 in the air into which the flame is projected. When the aperture between the tube contg. the explosive mixt. and that contg. air was reduced, an increase in the length of the projected flame was obtained with mixts. contg. an excess of CH_4, unless the aperture was very small, when the length of projection with all mixts. of CH_4 + air was considerably reduced. The projection of flame into CO_2 was shorter than into air, it being about 3 times the length of the original column of the explosive mixt., with an unconstricted tube. If the aperture between the explosion-tube and the extension-tube was constricted, the projection of flame into CO_2 was reduced in length. Hence, it is suggested that success should attend the use of CO_2 at the mouth of a stopping when sealing off a gob fire, to act as a "blanket" to minimize the distance of projection of flame, should an explosion occur behind the stopping. CHARLES E. MUNROE

How are fires best prevented? K. HAERTING. *Z. angew. Chem.* **39**, 199–200 (1926).—A classification of various types of fire extinguishers adding to the classification of *Ibid* **38**, 629 the 3 classes: (1) Wet extinguishers giving foam; (2) wet extinguishers using CCl_4 or CH_3Br; (3) dry extinguishers contg. only dry powders. It is suggested that stone dust owes its efficacy in stopping fires to its prevention of free air circulation at many points near the flame and that most other successful extinguishers act in a similar way. M. A. YOUTZ

Fire hazards from hydrogen peroxide solution of high concentration. G. AGDE AND E ALBERTI. *Z. angew. Chem.* **39**, 1033–5(1926).—A fire occurred in a freight car loaded with H_2O_2 (60% soln.) in 25-l. containers. It was known that spontaneous combustion could occur with such a soln. and certain org. material; that the decompn. of H_2O_2 could be hastened by the presence of H_2SO_4, alkalies, substances of large sp. area (*e. g.*, metals) and by contact with org. matter; and that solns. of low concn. decompose more rapidly than those with high concn. Extensive expts. showed that in the presence of catalyzers favoring decompn., including finely divided metals, charcoal, dust, sweepings from wooden floors, many kinds of industrial wastes, etc., 60% H_2O_2 soln. brings about a rapid increase in temp. and ignition of packing materials. W. C. EBAUGH

Influence of sunlight on trinitrotoluene. DOMENICO LODATI. *Giorn. chim. ind. applicata* **7**, 572(1925).—L. confutes the assertion of Krauz and Turek (*C. A.* **19**, 2747) that TNT exposed to sunlight shows a greater sensitiveness to shock, which they attribute to the autoformation of picric and trinitrobenzoic acids. L. exposed TNT to diffuse light for 3 months instead of for 14 days as the others had done, and believes that under that condition TNT develops nitrous vapors. ROBERT S. POSMONTIER

The law of combustion of colloidal powders. HENRI MURAOUR. *Bull. soc. chim.* **39**, 981–8, 1115–9(1926).—A mathematical discussion of the law governing the combustion of smokeless powder. CHARLES E. MUNROE

Shipping of dangerous chemicals and explosives. ANON. *Chem. Age* (London) **15**, 292–3(1926).—A review of the regulations for carriage of various substances recently issued by the British Board of Trade in which the provisions for many important chem. substances are set forth. The regulations appear to cover both land and water transportation. CHARLES E. MUNROE

Safety container for primer: A device for decreasing the danger of loading primers in lead-zinc mines. W. T. CLOUD. *Am. Zinc, Lead and Copper J.* **18**, 4–5(1926).—The device is described with illustrations. CHARLES E. MUNROE

The propagation of flame in mixtures of methane and air. IV. The effect of restrictions in the path of the flame. W. R. CHAPMAN AND R. V. WHEELER. *J. Chem. Soc.* **1926**, 2139–47.—Expts. were conducted in a horizontal brass tube, open at both ends, and provided with quartz windows, the tube being also provided, at desired intervals, with restricting rings. The system was filled with CH_4-air mixts. of 9.5–10% CH_4 content (the mixt. in which flame normally travels fastest) to which Cu salts

were added to render the flame highly actinic, and the flame, on ignition, photographed. It is concluded that, during the propagation of flame in such a tube, the unburnt mixt. in advance of the flame-front is traveling as a current in the same direction as the flame which is therefore traveling in a medium that is itself in motion. The general effects of a restriction in the tube on the speed with which the flame travels from point to point along it can be explained as being effects on the speed of the medium in which the flame is moving. The sequence of events is as follows: When a restriction is ahead of the flame the resistance it offers to the movement of the unburnt mixt. causes the current, and therefore the flame, to move more slowly. Just as the resisting ring is approached, the convergence of lines of flow causes a slight acceleration of the current, and then of the flame. The flame passes through the restricting ring as a thin tongue and spreads internally, so that just beyond the restriction the burning "layer" of mixt. suddenly becomes considerably thicker than the normal and there is an abnormal amt. of the mixt. burned locally. There is, in consequence, an enhanced speed now given to the current of unknown mixt ahead of the flame, while part of the burning gas is forced through the restriction. Thereafter, the flame moves, relatively to the walls of the tube, more rapidly because the current of mixt in which it propagates is moving more rapidly.
CHARLES E. MUNROE

Trinitrotoluene. R H GARTNER. Brit. 243,550, Dec. 29, 1924. Trinitrotoluene is freed from tetranitromethane by passing it from a melting tank through nozzles where it is atomized by heated air or gases or steam into a settling chamber also supplied with heated air or gases or steam and to the lower portion of which cold air is supplied.

Low-density dynamite. W R. SWINT. U. S. 1,603,164, Oct. 12. A dynamite prepd. by use of a liquid explosive ingredient such as nitroglycerin together with NH_4NO_3 and bagasse pith has a d. such that a $1^1/_4''$ by $8''$ cartridge will weigh less than 146 g. and has a velocity less than 2500 m./sec.

Waterproofing match heads, stems or striking compositions with vulcanized rubber latex or emulsion. M. M. DESSAU Brit. 243,047, Aug. 14, 1924.

Miner's electric lamp for detecting combustible gases. W. M. THORNTON. Brit. 243,526, Nov. 27, 1924

Miner's electric lamp with a platinum detector for explosive and combustible gases. A. G. GULLIFORD. Brit. 243,496, Oct. 25, 1924.

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

The dyestuffs industry, forerunner of what? IRÉNÉE DU PONT. *Ind. Eng. Chem* **18,** 1002–5; *Am. Dyestuff Rept* **15,** 627–31.—A review of the progress of the dye industry is based upon statistics for 1914 (largely before the war, when U. S. A. was dependent upon Germany), 1919 (immediately after the war, with its 5-year embargo on the importation of dyes), and 1925 (most recent year available after a period of tariff protection). The embargo resulted in the establishment of a real dyestuffs industry, and—so far as tonnage is concerned—a commensurate progress has not been made during the period of tariff protection. The immense advances in America's production of photographic chemicals, medicinals, flavors, perfumes, synthetic tanning materials, synthetic resins, rubber accelerators, anti-knock fuels, new varieties of lacquer with nitrocellulose as a base, flotation practice, etc. are shown. Future advances include synthetic fuels for motors, better use of radiant energy, lessened ravages of corrosion, regulation of sleep by catalytic agents influencing the elimination of accumulated autointoxicants, prepn of substances to improve one's thinking, disposition and other mental attributes, etc. Coöperative research is recommended as a means for speeding up results "The greatest danger to further and phenomenal progress in chemistry is degeneracy in government."
W. C. EBAUGH

Dyeworks alkalies from waste. E. T. ELLIS. *Dyer & Calico Printer* **56,** 112–3

(1926).—Suggestions are made for the prepn. of alkalies from waste and other materials. CHAS. E. MULLIN

Dyeing cotton with acid dyes. A. P. SACHS. *Textile Colorist* **48**, 601-3(1926).—Immunized cotton, produced by treating normal cotton with toluenesulfonlychloride, is treated with NH_3 or some other base capable of introducing the amino group. This basic group in the cellulose gives it a strong affinity for the acid dyestuffs, with which it appears to form a compd. CHAS. E. MULLIN

The dyeing of cotton artificial silk piece goods. H. BLACKSHAW. *Dyer & Calico Printer* **55**, 130-1, 192-3, 205, 225(1926).—The dyeing of viscose and acetate silk in combination with cotton is discussed. CHAS E. MULLIN

Pigments. MARCEL DEJODE. *Rev. gén. mat. color.* **29**, 292-4, 328-9; **30**, 104-5, 137 8, 200-1(1925-6).—Particular directions are given for dyeing cotton with *m*-nitroaniline orange, *p*-nitroaniline red, α-naphthylamine Bordeaux, and benzidine brown. L. W. RIGGS

Reduction products of azo dyes. W. C. HOLMES. *Am. Dyestuff Rept.* **14**, 647-50, 686-7, 705, 732-3, 740, 753-4, 776, 807-9, 821-2, 840(1925); **15**, 72-4, 100-1, 108, 179 81, 221-3, 240-2, 269-71, 302-4, 374-6, 405-7, 436-8, 450-2, 490-2, 523-5, 587-9 (1926) —These first 20 papers on this subject give a digest of all available information on the reduction products of 268 dyes published in the Color Index, together with data on such properties and reactions as would be of service in their identification. The work is still in progress. L. W. RIGGS

Identification of naphthalenoid reduction products of azo dyes. R. B. FOSTER AND T. H. HANSON. *J. Soc. Dyers Colourists* **42**, 272-5(1926).—The successive steps employed were: reduction of the dye to amino compds., isolation of the volatile reduction products by distn., isolation of the non-volatile products by extn. with C_6H_6, and the application of a reagent to produce a color reaction. In the latter step 15 reagents were used and the results are tabulated on a sheet equiv. to 9 pages of the journal. L. W. RIGGS

Developed or azo colors on acetate silk. CHAS. E. MULLIN. *Canadian Colorist & Textile Processor* **6**, 228-32, 262-3, 276(1926).—The general theory and methods of application. CHAS. E. MULLIN

The ionamine dyes on acetate silk. CHAS. E. MULLIN. *Canadian Colorist & Textile Processor* **6**, 292-9(1926).—The theory, development, constitution and application of these dyestuffs, as well as the properties of the resulting colors on the fiber are discussed. CHAS. E. MULLIN

Special components for developed colors (on acetate silk). CHAS. E. MULLIN. *Canadian Colorist & Textile Processor* **6**, 268-77(1926).—The *Acedronoles, Acetylines, Azonides, Azonines, Azoles, Azoics, Silkons,* and other azo color components are discussed CHAS. E. MULLIN

Identification and dyeing of artificial silk. ANON. *Chemicals* **26**, No. 15, 20-1 (1926) —*Lustron* is sol. in $CHCl_3$ but *Celanese* is not sol., merely forming a jelly. CHAS. E. MULLIN

Swelling agents in dyeing acetate silk. CHAS. E. MULLIN. *Canadian Colorist & Textile Processor* **6**, 213(1926).—Description of an obsolete method. C. E. M.

Dyeing acetate silk by saponification. CHAS. E. MULLIN. *Canadian Colorist & Textile Processor* **6**, 198-200, 210(1926); cf. *C. A.* **20**, 2908 and 3087.—While this method is no longer used in dyeing, it is of interest to dyers in connection with dyeing troubles CHAS. E. MULLIN

Mordants from waste materials. E. T. ELLIS. *Dyer & Calico Printer* **56**, 70-1 (1926).—The prepn. of Al, Cu, Fe and Sn mordants from waste materials is briefly discussed. CHAS. E. MULLIN

Formic acid. H. O. RICHARDSON. *Dyer & Calico Printer* **56**, 104-5(1926).—The uses of formic acid as applied to textile and dyeing industries are given. CHAS. E. MULLIN

Early history of the redwood industry in tropical America. C. D. MELL. *Textile Colorist* **48**, 609-11(1926). C. E. MULLIN

Auramine. JAMES SCOTT. *Dyer & Calico Printer* **56**, 90-2(1926).—A discussion of the reactions of auramine on the fiber and 6 photomicrographs showing its cryst. forms. CHAS. E. MULLIN

Protein compounds. III. CHAS. E. MULLIN. *Am. Dyestuff Rept.* **15**, 607-15 (1926); cf. *C. A.* **20**, 3352.—Work on base-protein-acid compds. and the halogen and S compds. of the proteins is reviewed. L. W. RIGGS

The tassah silk industry of Bihar. ANON. *Silk J.* **3**, No. 27, 51(1926).—The characteristics of this particular type of silk are briefly reviewed. C. E. MULLIN

Pioneers of artificial-silk production. I. Sir Joseph Wilson Swan. WM. BENNETT AND A. H. HARD. *Silk J.* **3,** No. 25, 59–60(1926). **II. Count Chardonnet.** *Ibid* No. 26, 64–5. **III. W. P. Dreaper.** *Ibid* No. 27, 62–3. **IV. Charles Frederick Topham.** *Ibid* No. 28, 59–60, 64.—Bibliography with pictures and an account of their work on rayon. CHAS. E. MULLIN

Artificial-silk standards. N. U. BERCHIN. *Chem.-Ztg.* **50,** 643(1926).—In attempting to set a standard of quality for artificial silk, B. compares the most important measurable properties of rayon with analogous properties of natural silk. He compares the product of the tensile strength dry, by the tensile strength wet, by the elasticity of rayon with the analogous product of natural silk. This product for natural silk is 2.5 g./denier × 2 g. × 20 = 100. For rayon 2 g. × 0.65 g. × 20 = 26. But, considering the factors of luster whiteness, and tendency to become yellow a ratio more favorable to rayon is given. For natural silk 2.5 g. × 2 g. × 20 × 0.5 (whiteness factor) × 0.5 (luster) × 0.95 (yellowing tendency) = 23.95. For rayon 2 g. × 0.65 g. × 20 × 1 (whiteness) × 1 (luster) × 1 (yellowing tendency) = 26. B. recognizes the difficulties in accurately applying these standards in practice. C. E. P. JEFFREYS

The finishing of artificial-silk fabrics and mixed fabrics. WM. BENNETT. *Silk J.* **3,** No. 26, 66–7(1926).—The conditioning, lustering, stiffening and finishing are discussed and several finishing mixt. formulas are given. CHAS. E. MULLIN

Finishing artificial silk and mixture fabrics for special purposes. WM. BENNETT. *Silk J.* **3,** No. 28, 61, 66(1926).—Finishing artificial flowers and leaves, shoe and slipper linings, etc. CHAS. E. MULLIN

The latest products in artificial silk. W. SUCHANCK. *Silk J.* **3,** No. 27, 57–60 (1926).—A few of the recent developments are briefly discussed. CHAS. E. MULLIN

New mercerizing press for artificial silk production. ANON. *Silk J.* **3,** No. 27, 74(1926).—A description of the M. Hausser press for the removal of caustic soln. from the mercerized cellulose in the manuf. of viscose. CHAS. E. MULLIN

Treating silks in the cleaning plant. F. M. HERFURTH. *Canadian Colorist & Textile Processor* **6,** 312(1926).—A wet-dry process of cleaning is briefly described wherein the silk dress is first wet-out with gasoline or solvent contg. glacial AcOH, EtOAc and acetone, and then with H_2O contg. "liquid seal oil," soap or tetrapol. CHAS. E. MULLIN

The general properties of acetate silk. CHAS. E. MULLIN. *Textile Colorist* **48,** 459–62(1926).—A discussion of the phys., chem. and textile properties, except dyeing properties, of acetate silk. Eleven tables. CHAS. E. MULLIN

Increase in the strength of wet artificial silk by the action of formaldehyde. WALTER BRUCKHAUS. *Oesterr. Chem.-Ztg.* **29,** 156–7(1926).—The treatment of artificial silk with HCHO aims to change the fiber, tender when wet, into a form more resistant to water and alkalies. Either skeins or piece goods are treated by impregnating them in a soln. made of 2 kg. alum, 25 kg. lactic acid (30%) and 12 kg. HCHO (40%) in 35–40 l. H_2O. The material is centrifuged in an ebonite container to 100% moisture, carefully dried at 60°, then soaped in soln. of 5–7 g. Marseillaise soap per l., revived with 1% lactic acid or 0.3% AcOH and dried at low temp. This treatment gives greater stability toward moisture and alkalies and greater absorptive power for dyes. The compn. of the impregnating bath may be different for the different silks. The ratios given for the strength of the untreated to treated silk are for nitrosilk: dry 100:140, wet 100:350; for viscose and cuproammonium, dry 100:135, wet 100:355. The treated silk is whiter, more pliable and makes up better. C. E. P. JEFFREYS

The purification of waste liquors from artificial-silk plants and mercerization processes. A. SCHROHE. *Papierfabr.* **24,** Tech.-Wiss. Teil, 297–9(1926).—A brief review of German patents. J. L. PARSONS

The purification of waste liquors from artificial-silk factories and after mercerization. E. PROFELD. *Papierfabr.* **24,** Tech.-Wiss. Teil, **24,** 520–1(1926).—A brief discussion of 5 German patents, nos. 350,428, 355,836, 381,798, 388,791 and 322,461, relating to the purification of waste liquors from rayon and mercerization operations. J. L. PARSONS

Silk and rayon. R. PRESGRAVE. *Canadian Colorist & Textile Processor* **6,** 234–5, 244–5(1926).—The fibers are compared on the basis of luster, dyeing properties, handle, conductivity, hygroscopicity, tensile strength, elasticity, ductility, friability, resiliency, sp. gr., cleanliness, plasticity, imperfections and price. CHAS. E. MULLIN

Rayon experimental plant and training school. A. G. PERL. *Textile World* **70,** 2004–5(1926).—A brief description of the exptl. plant, which is also used as a training school, of Oscar Kohorn and Co., Chemnitz and Vienna. CHAS. E. MULLIN

Future of rayon depends upon research. W. F. EDWARDS. *Textile World* 70, 2005–6, 2018(1926). CHAS. E. MULLIN

Rayon manufacture. E. WURTZ. *Ver. deut. Ing.* 69, 1581–8(1925).—A well-illustrated description of the practice of viscose rayon manuf., with considerable detail as to design, productivity and power requirements of machinery. In the operations described, the raw cellulose is brought to a definite H_2O content in special driers, and mercerized with 18.5% NaOH soln., made from caustic which assays at least 97% NaOH. The immersion takes 2 hrs., and the liquor is kept at 15°. The pressure applied in squeezing out is sufficient to produce an alkali cellulose which weighs 3.2 times the wt. of the dry cellulose in it. The aging of the shredded alkali-cellulose is carried out at 23–25° in closed 35 l. cans. Hexagonal rather than round sulfiding drums are preferred and these should have a capacity of 1300 l. to 100 kg. dry cellulose. The final viscose soln. contains 7.5–8.0% cellulose and 6.5–7.0% NaOH. Spool spinning is more costly than centrifugal spinning but produces better results. E. R. C.

Progress in British rayon industry. J. GUTHERIE OLIVER. *Textile World* 70, 2006, 2020(1926). CHAS. E. MULLIN

Processing cotton-rayon piece goods. W. W. CHASE. *Textile World* 70, 2016–8 (1926).—The scouring, bleaching and dyeing of cotton-rayon piece goods are discussed. CHAS. E. MULLIN

Analysis of rayon-worsted yarns. ANON. *Textile World* 70, 2026(1926).—In the analysis of *acetate silk-wool* mixts. it is suggested to dissolve out the rayon by boiling the sample in 70% or stronger AcOH. A correction factor is used in calcg. the percentage of wool. CHAS. E. MULLIN

Processing rayon hosiery. ANON. *Textile World* 70, 2023(1926).—Bleaching, dyeing and finishing are briefly discussed. CHAS. E. MULLIN

Domestic rayon output increases about 20%. D. G. WOOLF. *Textile World* 70, 1996–7(1926); cf. *C. A.* 20, 293.—Tables of production and importation are given. CHAS. E. MULLIN

Links in the European rayon chain. ANON. *Textile World* 70, 2002–3(1926).—A description of the international connections of the various producers. C. E. M.

Ripening of viscose. R. O. HERZOG. *Papierfabr.* 24, Festheft, 94–6(1926).—Empirical formulas are given for calcg. the relative rates of reactions occurring during the viscose-ripening process; this appears to be a slow coagulation in which the secondary particles, formed from the primary ones, arrange themselves in rod form. Salting-out, modulus of elasticity and viscosity are discussed. J. L. PARSONS

Viscose as a textile finish. E. H. MORSE. *Textile World* 70, 1709–11(1926).—Viscose finishes are permanent and waterproof but little information is available regarding their use. Very general information regarding their application is given. CHAS. E. MULLIN

Differentiation between viscose and copper silks by color reactions. P. KRAIS. *Papierfabr* 24, Tech.-Wiss. Teil, 330–1(1926).—The Rhodes, Götze and Cassella tests for differentiating between viscose and copper silks are compared. The Rhodes $AgNO_3$ test and the Cassella coloration with naphthylamine black 4B are recommended as giving the best color reactions, independent of the denier of the fiber. J. L. P.

Distinguishing viscose from cuprammonium (silk). W. T. SCHREIBER AND H. HAMM. *Textile World* 70, 2029(1926).—A 5-g. sample of viscose or cuprammonium silk is treated in a flask with 100 cc. H_2O and 3 cc. concd. H_2SO_4 on a moderately boiling steam bath for 4 hrs., the mouth of the flask being entirely closed by a diaphragm of filter paper satd. with a 10% Pb acetate soln. The S compds. present in viscose cause a brown or black stain on the paper, which does not appear in the cuprammonium silk. It was impossible to identify viscose from traces of CS_2 remaining in it. CHAS. E. MULLIN

Textile analytical microscopy. W. GARNER. *J. Soc. Dyers Colourists* 42, 261–72 (1926).—The technic of section cutting of fibers and the appearances of various fibers under the microscope are described. L. W. R.

Possibilities of so-called "staple fiber." W. HOWARD CANNING. *Textile World* 70, 2001(1926).—The uses and possibilities of staple fiber, also called *artificial wool, Vistra* and *Sniafil*, are discussed. CHAS. E. MULLIN

Oils and oil products in textile processes. H. C. ROBERTS. *Textile World* 70, 2021–2(1926).—The application and removal of oils for lubrication, the use of sulfonated oils in dyeing and softening oils are discussed. CHAS. E. MULLIN

Amidation of cotton. P. KARRER AND W. WEHRLI. *Helvetica Chim. Acta* 9, 591–7 (1926).—Cotton may be amidated by first treating with toluenesulfonyl choride and treating the product with aq. ammonia or an aliphatic amine. The amidated

cotton possesses an affinity for acid dyes. Aromatic amines may also be used but the affinity in the product formed, for acid dyes is not so strong as with the NH_3 or aliphatic amines. R. C. NEWTON

Printing cotton by the indigo-glucose method. ANON. *Textile Colorist* **48**, 617–20(1926).—Formulas are given. CHAS. E. MULLIN

Detection of mercerized cotton. CHAS. E. MULLIN. *Textile Colorist* **48**, 599–601 (1926).—A review of the various methods used in detecting the mercerization treatment on cotton and in the estn. of the extent of the treatment, as well as the differentiation of mercerized cotton and rayon. CHAS. E. MULLIN

Celanese as a fabric builder. C. W. PALMER. *Textile Recorder* **44**, No. 520, 85–6(1926).—The properties of celanese and cotton, in relation to weaving, are considered. CHAS. E. MULLIN

The treatment of celanese and its uses. R. V. PATCHETT. *Textile Recorder* **44**, No. 522, 77–9(1926).—The winding, warping and weaving of celanese are considered. Where sizing materials contg. gelatin are present, the goods must be soaked for some time in cold H_2O to swell the gelatin before heating the bath to remove the size. CHAS. E. MULLIN

Theory and practice of drying as applied to woolen and cotton products. FREDERICK KERSHAW. *Textile Colorist* **48**, 626–30(1926). CHAS. E. MULLIN

Kapok. ANON. *Textile Recorder* **44**, No. 521, 45–6(1926).—Its production in the British Empire, cultivation and uses. CHAS. E. MULLIN

The recovery of by-products from wool-scour effluent. MEDALION. *Textile Recorder* **44**, No. 521, 55–7(1926).—A brief review of the various methods which have been proposed or used for the recovery of wool grease and K from used scouring liquors. CHAS. E. MULLIN

Electrical refrigeration in textile mills. F. W. STURTEVANT. *Textile World* **70**, 1307–8, 1873–5(1926). CHAS. E. MULLIN

The steam accumulator in textile mills. C. L. HUBBARD. *Textile World* **70**, 1303–6(1926). CHAS. E. MULLIN

The steam accumulator in the textile industry. K. GEHRENBECK. *Apparatebau* **38**, 219–23(1926); 6 cuts.—Descriptions of a hot-H_2O accumulator and of Ruth's accumulator (cf. *C. A.* **17**, 2524, 2977; **18**, 2445, 2981; **19**, 2275). J. H. MOORE

A less hazardous dry cleaning solvent. LLOYD E. JACKSON. *Canadian Dyer & Calico Printer* **6**, 185–8(1926).—The present requirements and solvents are discussed, and specifications for a suitable solvent are given. CHAS. E. MULLIN

Corrosion of Ni-alloy singe rolls (TRAVIS) **9**. Dyeing of leather (Brit. pat. 243,144) **29**. Benzanthronyl nitriles (Brit. pat. 243,026) **10**. Drying silk (U. S. pat. 1,567,031) **13**.

REINTHALER, FRANZ: **Die Kunstseide.** Berlin: J. Springer. 165 pp. 14.40 M. Reviewed in *Papierfabr.* **24**, 474–5(1926).

Dyes. F. GUNTHER. U. S. 1,567,731, Dec. 29, 1925. Products for dyeing cellulose and the like are obtained by the action of "carbonic acid halogenides" such as phosgene or alkylchloroformates on aromatic *o*-aminocarboxylic acids other than the uncolored anthranilic acids. The products combine with cellulose and the combination may be subjected to diazotization and combination with other dye components. Several examples are given.

Dyes. BRITISH DYESTUFFS CORPORATION, LTD., J. BADDILEY, J. HILL and A. RILEY. Brit. 243,115, Sept. 17, 1924. Monoazo dyes are produced by diazotizing the anhydro bases made by reaction of at least 1 mol. proportion of CH_2O with 1 mol. proportion of an aromatic amine in the presence of acid and coupling with sulfonated coupling components. The products dye wool yellow to red to brown shades fast to milling. Numerous examples are given.

Dyes. BADISCHE ANILIN & SODA FABRIK. Brit. 242,837, Feb. 18, 1925. Dyes similar to or identical with those described in Brit. pat. No. 204,249 (*C. A.* **18**, 908) are obtained by condensing a 1-halogen-2-aminoanthraquinone or its derivs. with terephthaloyl chloride, oxalyl chloride or other aromatic compd. contg. at least 2 substituents with reactive C atoms (such as carboxylic chloride groups or di- or tri-halogenmethyl groups) and treating the products with substances capable of giving off S, such as sol. sulfides or polysulfides or xanthates. The products dye cotton from the vat in yellow shades.

Dyes. Badische Anilin & Soda Fabrik. Brit. 242,620, Nov. 7, 1924. Isodibenzanthrone dyes are obtained by treating with alk. condensing agents, with or without inert diluents, benzanthrone thio ethers or substitution derivs. having a free 2-position. Alkyl, aryl, anthraquinonyl, benzanthronyl and other thio ethers may be used, and the reaction may, *e. g.*, be carried out in the presence of KOH and EtOH at a temp. of 135–145°. Benzanthrone *p*-thiocresyl ether (which may be used as one of the starting materials for these dyes) is made by heating chlorobenzanthrone with *p*-thiocresol and alc. KOH. Benzanthronyl sulfide is obtained by heating benzanthrone mercaptan with Cu and $C_{10}H_8$.

Dyes. Soc. anon. pour l'ind. chim. à Bâle. Brit. 242,867, March 30, 1925. Insol. azo dyes are produced either in substance or on the fiber by coupling unsulfonated diazo, tetrazo, diazoazo or similar compds. with the *p*-hydroxynaphthyl-1,3,5-triazine derivs. such as described in Brit. pat. No 220,302 or 240,731 (*C. A.* **20,** 2252). The products made in substance may be used for the prepn. of lakes. The dyes produce various shades ranging from yellowish red to blue and black. Numerous examples are given

Dyes. A. Zinke. Brit. 242,306, Nov. 3, 1924. Diaroylhalogenperylenes are treated with basic alkali or alk. earth metal compds. at high temp., preferably in the presence of an org. solvent; *e. g.*, dibenzoyldibromoperylene is treated with powd KOH in boiling aniline or with molten alkali; the product dyes cotton blue from a blue vat Several other examples are given. Cf. *C. A.* **20,** 3576.

Dyes and intermediates. Farbenfabriken vorm. F. Bayer & Co. Brit. 243,557, Jan 12, 1925. Carbazolecarboxylic acid amides are prepd. by condensing the corresponding carboxylic acids with primary or secondary aliphatic or aromatic amines in the presence of PCl_3 or other suitable condensing agent. Carbazolic acid amides are converted into indophenols by condensation with *p*-nitrosophenols. Sulfuretted dyes are prepd. from the indophenols by ordinary sulfurizing processes. They dye cotton from a hyposulfite vat dark blue, bluish black and greenish black shades. Various examples are given.

Trisazo dye. H. Schweitzer. U. S. 1,602,991, Oct. 12. A dye giving bright fast greenish blue shades on cotton is formed from 3,6-disulfobenzene-1-azo-4-naphthalene-1-azo-4-naphthalene-1-diazo-2-ethoxy-6-sulfonic acid by coupling with 2-phenylamino-5-naphthol-7-sulfonic acid in the presence of pyridine. Other dyes giving blue and green shades may be formed from similar components.

Azo dye. W. Duisberg, W. Hentrich, J. Huismann and L. Zeh. U. S. 1,603,002, Oct 12. 4-Acetylethylaminobenzene-1-azo(*N*-acetylaminoethyl)-2-amino-8-hydroxynaphthalene-3,6-disulfonic acid dyes wool reddish brown level shades fast to light and to milling.

Azo dyes. A. Zitscher. U. S. 1,594,865, Aug. 3. Azo dyes are formed by combining diazo compds., not contg. a sulfonic or carboxylic group, with acetoacetyl compounds of the general formula: $YCOCH_2CONHRN{:}NR'$, in which Y represents any radical of the hydrocarbon series contg. from 1 to 6 C atoms, R an aryl residue and R′ an aromatic residue. A large number of examples are given, the dyes produced giving, in general, yellow or orange shades.

Azo dyes containing a diphenylurea nucleus. H. Wenker. U. S. 1,594,805 Aug 3 Dyes producing green shades on cotton are formed from the Na salts of such compds as *p*-aminobenzeneazo-3,6-disulfo-1-amino-8-naphtholazobenzene and *p*-aminobenzeneazosalicylic acid by treatment with phosgene in Na_2CO_3 soln. The dyes produced can be readily discharged from cotton by $Na_2S_2O_4$.

Yellowish red azo dyes. H. Wagner and A. Funke. U. S. 1,595,269, Aug. 10 Dyes giving lakes fast to light are produced by combining 3-nitro-4-diazo-1-phenol ethers, *e. g*, the Et or Me ethers, with an acetoacetanilide which is substituted either by an alkyl group in *o*-position to the NH_2 group or by an alkyloxy group in *p*-position to the NH_2 group, *e. g.*, acetoaceto-*o*-toluidide or acetoaceto-*p*-anisidide.

Dyes of the anthraquinone series. P. Schetelig. U. S. 1,568,627, Jan. 5. Nuclear-halogen derivs. of 1,3,5-triazine such as cyanuric chloride are caused to react on -(or 8)-amino-2,1-anthraquinoneacridones, forming dyes which produce fast red violet to bordeaux and gray tints on cotton.

Oxazine dyes of the anthraquinone series. R. E. Schmidt and B. Stein. U. S. 1,596,460, Aug. 17. Purpuramide may be oxidized alone to homonuclear quinoni compds and these may then be condensed with substituted benzoic acids such as salicylic acid, cresotinic acid, anthranilic acid, or phenylglycine-*o*-carboxylic acid to produce, probably, heteronuclear quinones or quinoneimides, and these products are reduced to oxazines. MnO_2 in H_2SO_4 soln. may be used as the oxidizing agen

and SO_2 or an alkali metal H sulfite as the reducing agent. The oxazine dyes produced dye wool in an acid bath blue to green shades; on wool mordanted with Cr or Al salts they give similar shades fast to milling and to light. Several examples are given.

Green sulfurized dyes. E. REBER and J. FRÖHLICH. U. S. 1,568,622, Jan. 5. Indophenols which are obtained from *p*-aminophenol and *N*-alkyl or aralkyl-α-naphthylamine may be converted into sulfonated derivs. of 1-alkyl- or 1-aralkylamino-4-*p*'-hydroxyphenylnaphthylamines by treatment with salts of H_2SO_3 such as $NaHSO_3$. By heating these sulfonated derivs. with alkali metal polysulfides in the presence of Cu, sulfurized dyes are obtained which dye vegetable fiber green tints fast to boiling alk soap solns

Alkyl-arylsulfaminonaphtholsulfonic acid azo dyes. W. NEELMEIER and T NOCKEN. U. S 1,602,776, Oct 12 Diazotized *o*-phenetidine or other diazotized aromatic amines are combined with alkyl-arylsulfaminonaphtholsulfonic acids such as 1-ethyl-*p*-toluenesulfamino-8-naphthol-3,6-disulfonic acid to produce dark red to blue powders, sol in H_2O and dyeing wool from an acid bath from red to blue fast shades

Acetoacetyldehydrothiotoluidine and similar compounds. A. ZITSCHER. U. S 1,594,866, Aug 3. Acetoacetyldehydrothiotoluidine is formed by heating acetoacetic acid ester with dehydrothiotoluidine in a diluent such as $C_{10}H_8$. It m. 170–2° (with slight decompn). Similar reactions may be carried out with other bases and other acylacetic acid esters such as benzoylacetic acid ester. The products may be used as dye components

Diacylacetyldiamino compounds of the diaryl series. A. ZITSCHER and R. SCHMITT U. S. 1,594,864, Aug 3. Compds. of this type (which are dye intermediates) are formed by heating diaminodiaryl bases with acylacetic acid esters in a diluent. Among the compds which are thus prepd are: diacetoacetyl-*o*-tolidine, m. 204–5° (decompn.) diacetoacetyl-*o,o*'-dichlorobenzidine (decomposes at 145–7°); diacetoacetyl-*m,m*' dichlorobenzidine (decomposes at 212°); diacetoacetyldianisidine (m. 164–5° with decompn.); dibenzoylacetylbenzidine, m. 248° (decompn.); and dibenzoylacetyl-*o*-tolidine, m 233° (decompn).

Acylacetyl compounds containing azo or azoxy groups. A. ZITSCHER. U. S 1,594,867, Aug. 3. Compds of this type (which are suitable for the manuf. of dyes) are obtained by heating acetoacetic acid ester or its homologs or analogs, such as benzoylacetic acid ester, with monoamino bases such as benzeneazo-1-naphthylamine or 4-aminoazobenzene. Several specific examples are given.

Phenol-sulfur compounds. AKT.-GES. FÜR ANILIN-FABRIKATION. Brit. 242,974 Nov. 14, 1924. The process of Brit pat. No. 232,958 (*C. A.* **20**, 296) for prepg. colorless mordants by the action of a phenolsulfonic acid upon a resinous substance prepd from a phenol and S chloride is modified by first sulfonating the resinous substance with strong H_2SO_4 while heating, *e. g.*, to 90–100°, and condensing the product with a phenol (present in excess) at a higher temp., *e. g.*, 210–220°. Excess phenol is finally distd off *in vacuo* at 240°.

Dyeing cellulose acetate. BRITISH CELANESE, LTD., AND G. H. ELLIS. Brit. 242,393, Sept. 19, 1924 In the process described in Brit. pat. No. 219,349 (*C. A* **19**, 579), instead of the solubilizing agents for the dyes specified in the original pat there are used sulfo aromatic fatty acids, such as sulfobenzenestearic acid, or their derivs such as sulfophenolstearic acid or sulfonaphthalenestearic acid or salts of these acids are used. Various examples and details are given.

Dyeing cellulose acetate. BRITISH CELANESE, LTD., G. H. ELLIS and W. O. GOLDTHORPE. Brit. 242,711, Aug. 14, 1924. In dyeing with relatively insol. dyes or org. compds for the production of dyes on the material, there are employed, in conjunction with the solubilizing agents specified in Brit. pat. 219,349 (*C. A.* **19**, 579), secondary or auxiliary solvents such as alkyl or alkylene halides (*e. g.*, $C_2H_2Cl_4$ or C_2HCl_3), simple or mixed cyclic or aromatic derivs. contg. 1 or more NH_2, Cl or OH groups (*e. g.*, cresols, alkylanilines, toluidines, chlorophenols or polychlorobenzenes), and hydrogenated derivs. of these or other aromatic compds. (*e. g.*, hexahydrophenol, hexahydrocresols, hexahydrobenzene, decahydronaphthalene or tetrahydronaphthalene Numerous examples are given. See Brit. pat. No. 224,925 (*C. A.* **19**, 1952).

Dyeing and printing cellulose esters. R. METZGER. U. S. 1,602,695, Oct. 12. Goods formed of cellulose acetate or other cellulose esters are treated with the sulfamic acid Na salt derived from 1,4-diaminoanthraquinone or other H_2O-sol. sulfamic acid derived from a colored amino compd. which is not a dye of itself, and the product may be further treated with azo dye components.

Dyeing with multicolor effects. J. RATH and W. CHRIST. U. S. 1,594,853, Aug. 3. Vat dyes such as algol brilliant violet R or indanthrene blue G C or alizarin indigo

7 G are superposed on vegetable fiber material portions which have been previously treated with combinations of arylamides of 2,3-hydroxynaphthoic acid or other azo dyes which are resistant to the action of boiling dil. NaOH soln. in the presence of cellulose (*i. e.*, fast to kier-boiling).

Dyeing rugs and similar articles. W. E. Olson. U. S. 1,602,446, Oct. 12. After applying the dye, the material is folded over a supporting device with small projections which contact with the material.

Apparatus for dyeing or other treatments of yarns or other fibrous or textile materials. A. Manzoni and E. Muller. Brit. 246,359, Nov. 18, 1924. Atomizers are arranged to spray H_2O and other treating liquids by the action of steam and air.

Dyeing apparatus. J. Dean. Brit. 242,790, Nov. 15, 1924.

Apparatus for dyeing fabrics in lengths. E. Cadgene. Brit. 242,936, Nov. 13, 1924.

Apparatus for dyeing yarn skeins, etc. J. Schlumpf. Brit. 242,857, March 14, 1925.

Vat dyeing apparatus with paddle wheels. H. E. Brewin and A. C. Mackey. U. S. 1,600,973, Sept. 28.

Textile material. J. F. Moseley. Can. 263,333, Aug. 10, 1926. A process for finishing textile materials in which agglutinant-sizing materials are used in conjunction with a colloidal silicate. Cf. *C. A.* **19**, 3600.

Artificial silk. M. Hirasawa. U. S. 1,603,080, Oct. 12. Fibrous substances such as silky cocoon material, the chief constituent of which is fibroid, are dissolved in a soln. of $ZnCl_2$ and the liquid is forced out of capillary nozzles and treated successsively with a soln. of an alkali acid sulfite such as NH_4HSO_3 and with an alc. CH_2O soln.

Artificial silk. S. Toda. Brit. 243,009, Nov. 14, 1924. See U. S. pat. 1,590,-784 (*C. A.* **20**, 3088).

Artificial silk. A. Eichengrün. Brit. 243,350, Nov. 20, 1924. Solns. of acetone-sol cellulose acetates or mixts. of these with $CHCl_3$-sol. cellulose acetates are prepd. by the use of CH_2Cl_2. Concd. solns. are obtained which permit high-speed spinning and a very short spinning distance. Softening agents, fillers and dyes may be used and a small proportion of MeOH or its homologs is added to form a suitable solvent together with the CH_2Cl_2. Acetone, triacetin, Et formate, a mixt. of EtOAc and alc. or a mixt. of alc. and C_6H_6 also may be used in the solvent, and the soln. may be used for making threads, ribbons or the like or for coating nitrocellulose silk.

Artificial silk from cellulose acetate or similar compositions. H. B. Roy. U. S. 1,602,125, Oct. 5. A filament-forming soln. is discharged into a current of heated air through which the filaments are conveyed and which serves to evap. the solvent from them and the filaments are then led out of the casing through which the air current passes and are continuously wound in the outside atm. An app. is described.

Artificial silk from viscose. C. Becker and A. Bernstein. Brit. 242,993, Nov. 14, 1924. Artificial silk prepd. from viscose, after the initial winding on bobbins and with or without washing to remove remnants of the acid coagulating-bath, is withdrawn from the bobbins, passed through a warm soln. of NaOH or other desulfurizing bath, then led through a weak acid bath and rewound by a winding device operating in washing H_2O.

Weighting silk. J. Roskow. U. S. 1,602,840, Oct. 12. Silk is treated with a soln. of $BaCl_2$ or other sol. Ba salt and, after drying, treated with a soln. of a sol. sulfate, e. g., Na_2SO_4 or H_2SO_4.

Sensitizing solution for fabrics. G. I. Keel. U. S. 1,597,899, Aug. 31. In order to produce designs on fine silk or similar fabrics (so that they are in part rendered pervious to colors sprayed through them in multi-color reproductions by the multi-screen color-spray method) the fabrics are exposed to light through a photographic negative after treatment with a compn. formed from glue, H_2O $(NH_4)_2Cr_2O_7$, egg albumin, clear NH_3 soln. and $AgNO_3$.

Testing the strength of yarns or similar materials. C. H. Robbins. U. S. 1,602,-213, Oct. 5. A method of standardizing humidity of material to be tested and of the atm. in which the tests are carried out is described.

Apparatus for mercerizing yarns. W. Koenigs and J. Kam. Brit. 243,380, Nov. 1924.

Treating wool, silk and other textile materials with a series of soap solutions. C. Duhamel and Compagnie Generale des Industries Textiles. Brit. 243,360, Sept. 7, 1923.

Shrinking woolens. G. H. WEITZEL. U. S. 1,601,838, Oct. 5. See Brit. 221,422 (*C. A.* **19,** 900).

Treating cotton with oil. R. B. SMITH. Brit. 242,593, Nov. 8, 1924. See U. S. 1,550,396 (*C. A.* **20,** 116).

Fabrics (for automobile tops or other uses) coated with a vulcanized mixture of rubber and glue. J. H. MASON. U. S. 1,602,986, Oct. 12.

Felting animal fibers. R. BACH. Brit. 243,301, Nov. 20, 1924. Hair is made into felts adapted for manuf. of hats after treating the fibers with aldehyde or ketone corrosives or with metallic salt corrosives such as those contg. Hg. The treatment may be applied to loose fibers, half-fulled felt or to hides, and among the suitable reagents specified are CH_2O, AcH, BzH or their compds. with bisulfites, acetone, acetoacetic ester, acetophenone or mixts. or compds. decompg. into aldehydes or ketones. A CH_2O soln. which is slightly acidified with H_2SO_4 or HCl may be used at temps. of 25–80°. After the treatment with the corrosive reagents, the material may be treated with oxidizing agents such as H_2O_2, permanganates, perborates or HNO_3.

Treating hat bodies of hair or wool. R. BACH. Brit. 243,317. To enhance the gloss of hats and give them a smooth finish, they are treated with aldehydes or ketones (or substances yielding these compds) and preferably subsequently treated with oxidizing agents, in a process similar to that of Brit. pat. no. 243,301 (above).

26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

Luminous paints. RONNEAUX. *Génie civil* **88,** 203–6(1926).—The development of these paints and their luminous and photographic properties are discussed.
JACK J. HINMAN, JR.

The importance of particle properties in paint pigments. C. A. KLEIN. *Trans. Inst. Rubber Ind.* **2,** 73 7(1926).—A crit. survey of various aspects. C. C. DAVIS

Accelerated test of paint and other finishes. M. SCHULZ. *Farben-Ztg.* **31,** 2879–82 (1926) —(1) The films on iron are allowed to dry for 3 days at room temp and are then exposed to a temp of 80° for 24 hrs. (2) They are dipped for 4 hrs. into distd. water at 20°. (3) Ultra-violet rays are directed for 2 hrs. upon the swelled, wet films and for 2 hrs. upon the dry films. (4) The films are immersed for 2 hrs. in distd water at 20°. (5) They are exposed for 24 hrs. to a wet atm. of CO_2 and air. (6) They are then exposed to ultra-violet rays during 1 hr. in a moist state at room temp., and during another hr in a dry state at 50°. (7) During 1 hr. the films are treated with a 1% SO_2 and air mixt. (8) They are exposed to a steam-satd. atm of 35-40° for 20 hrs. During this time and at certain intervals the films are dipped into distd. water of room temp. and then cooled down to —5° for 10–15 min. (9) The treatment with ultra-violet rays, as mentioned under 3, is repeated. (10) Finally, the series of treatments 2 to 9 is repeated 6 times. The app. is described. J. S.

Standards for white and colored paints over a white undercoat. ANON. *Farben-Ztg* **31,** 2825–6(1926).—A classification of the different tests and the quant. analysis of white lead, zinc oxide and total chromate are given. J. SCHALCH

The drying of pulverized, colored pigments. F. BUSCHMANN. *Farben-Ztg.* **31,** 2721–2(1926).—The color paste is disintegrated and blown into the drying tower by means of compressed air. A counter-current of hot air effects a rapid drying of the product. The process is continuous and economical. J. SCHALCH

Paint and varnish removers and their requirements. ERICH STOCK. *Farben-Ztg.* **31,** 2829–30(1926).—The removers are classified thus: (1) Saponifying agents, such as NaOH, KOH, NH_3, or mixts., which are used preferably as paste mixed with saw-dust, starch, chalk, etc. (2) Solvent mixts. contg. wax, paraffin and oils to prevent a rapid evapn. These also are used as paste. J. SCHALCH

Mechanism of lithopone formation. C. A. MANN. *Third Colloid Symposium Monograph* **1925,** 247–9.—See *C. A.* **20,** 2756. JEROME ALEXANDER

The preparation of India ink and crayons for lithography. HANS HADERT. *Farben-Ztg.* **31,** 2776–7(1926).—H. gives the following formulas for India ink in lumps: (1) Lampblack is mixed with gum arabic or tragacanth (dissolved in water) until a stiff paste is obtained. (2) Eight to 9 parts bleached beeswax, 2 parts water-free grain soap, 2 parts orange shellac, 2.5 parts gas-black. (3) Twenty parts mutton tallow, 20 parts pure, yellow beeswax, 18 parts white grain soap, 35 parts orange shellac, 25 parts mastic, 16 parts lampblack, 2.5 parts turpentine, rectified. (4) One hun-

dred parts yellow, pure beeswax, 100 parts light grain soap, 90 parts orange shellac, 55 parts mutton tallow, 40–50 parts lampblack, 45 parts soda ash (dissolved in water). The ingredients of these formulas are well mixed and fused together at a suitable temp. Crayons are prepd. by mixing and fusing the following products: (1) Sixty-five parts yellow, pure beeswax, 25 parts light grain soap, 16 parts lampblack, 2 parts c. p. saltpeter (dissolved in 14 parts water), 20 parts oil soap. (2) Fifty-five parts yellow, pure beeswax, 35 parts orange shellac, 40 parts light grain soap, 20 parts lampblack, 10 parts mutton tallow, 5 parts soda ash (dissolved in water). The French India ink (Lemercier) consists of 2 parts yellow, pure beeswax, 1.5 parts mutton tallow, 6.5 parts white tallow soap, 3 parts shellac, 1.5 parts lampblack. J. SCHALCH

Trade names of solvents, diluents and plasticizers of the cellulose lacquer industry. C. P. v. HOEK. *Farben-Ztg.* **31,** 2885–6(1926).—The corresponding chem. names are given. J. SCHALCH

The change of refractic index of linseed oil in the process of drying and its effect on the deterioration of oil paintings. A. P. LAURIE. *Proc. Roy. Soc.* (London) **112,** 176–81(1926).—The lowering of tone of oil paintings is discussed in detail, and it is made evident that not only the yellowing of linseed oil with age, but its steadily increasing *n* are the causes. Selection of proper pigments and a method of application in which light back-grounds or undercoatings are used are suggested as rational methods of avoiding the lowering of tone with age. A. W. KENNEY

Quantitative determination of the "break" (and foots) in linseed oil. GEO. S. JAMIESON AND W. F. BAUGHMAN. *J. Oil Fat Ind.* **3,** 307–9(1926).—Weigh 10 g. of sample in a 50-cc. flask and transfer with 50 cc. gasoline, b. p. less than 80°, into a 500-cc. pear-shaped separatory funnel. Shake, add 10 cc. of 14% KOH soln. and shake for 3 min. Then add 25 cc. of 50% alc., shake 15–20 sec. and allow to stand until the mixt. seps. Draw off the lower layer and the ppt. into a 200-cc. separatory funnel. Add 20 cc. of gasoline, shake and allow to sep. Draw off the lower layer and the ppt. into a 250-cc. beaker. Add the upper layer to the main gasoline soln. in the large separatory funnel. Pour the alc. alkali soln. back into the 200-cc. funnel and ext. with 20 cc. gasoline. Repeat this treatment a 3rd time. Save the alc. alkali soln. for the detn. of the fatty acids. Wash the gasoline soln. of the oil 3 times with 15 cc. portions of 50% alc. and add the washings to the alc. alkali soln. in the 250 cc. beaker. Transfer the soln. of the oil to a weighed 300-cc. Erlenmeyer flask. Distil off as much as possible of solvent by placing the flask in a H_2O bath; then heat at 120° to 125° in an oven, using an atm. of CO_2, and weigh to const. wt. Calc. the % of neutral oil. Place the beaker contg. the alc. alkali soln. on the steam bath and evap. the alc. Then add 75 cc. H_2O and acidify with HCl. Cool until the fatty acids become solid, filter and wash. Place the funnel contg. the filter paper and fatty acids in the 250-cc. beaker and heat on the steam bath until dry. Dissolve the fatty acids with small amts. of gasoline. Collect the filtrate and washings in a weighed 200-cc. Erlenmeyer flask. Remove the solvent as described for the detn. of neutral oil and weigh. Calc. the % of fatty acids. To obtain the % of break, subtract the percentages of neutral oil and fatty acids from 100. A table of results is given. There is no relation between quantity of break in ...

Lin...

CH—CH >O. The

observed low content of active O_2 (1 − 3%). Polymerization in drying is quantitatively greater than autoxidation. Mol. wt. detns. are dependent upon the degree of dispersion, the concn. of soln., the character of the solvent and the nature of the substance under examn. Neutralization nos., sapon. nos., and I nos. were detd. by E. and M. for the acids from fresh linseed-oil films, boiled-oil films, wood-oil gels (sol. and insol. acids), wood oil films and Tokyol films and the conclusions are drawn that natural drying shows a different type of polymerization than is met with in boiled-oil drying; it is more complex in the latter case, due not to the formation of anhydrides or lactones but to a rearrangement within the mols. of the fatty acids of the glyceride itself. In the natural films of the fatty oils the Rast method of mol. wt. detn. shows

no intramol. autopolymerization, but this is shown in boiled oils before drying. In general the mol. wt. detn. of oil films does not lead to any evaluation of the quality of an oil. The formation of stearic acid by hydrogenation of the least dispersed portion of boiled linseed oil proves the absence of any dioxane ring. P. ESCHER

Rosin for the floor-covering industry. R. B. ROHRER. Am. Soc. Testing Materials (preprint) No. **65,** 10–5(1926).—The grades used and reasons for the choice are mentioned. The effect of dirt, the m. p., phys. and chem. consts., cryst. rosin, and interchangeable substances are discussed. Wood rosin is generally used in the linoleum industry. The properties essential to rosin for floor coverings include: (1) ability to "dissolve" linoxyn, (2) absence of water, (3) light color consistent with price, (4) freedom from dirt, (5) uniformity of m. p., (6) absence of the cryst. variety. W. H. BOYNTON

Value of a direct measurement method for particle size determination (GREEN) **30.** The influence and elimination of coarse particles (HEATON) **30.**

Pigments. DEUTSCHE GASGLÜHLICHT-AUER-GES. Brit. 242,282, Oct. 31, 1924. Pigments contg. "acid of Ti" or other pigments are rendered permanent and prevented from affecting oil with which they are afterward mixed, by neutralizing any traces of free acid adhering to the particles by addn. of (usually about 5% of) ZnO or $Zn(OH)_2$, followed by filtering, washing, drying and heating to incandescence.

Titanium pigments. C. A. KLEIN and R. S. BROWN. Brit. 243,081, Aug. 25, 1924. In producing a Ti pigment with a base of $BaSO_4$, a slag of Ba and Ti oxides contg. some Fe is obtained by fusing rutile or ilmenite with a Ba compd. such as $BaCO_3$ with or without a flux such as fluorspar and a reducing agent. After removing Fe from the slag it is formed into a paste with H_2SO_4, the resulting mixt. of Ti and Ba sulfates is run into boiling H_2O in the presence of org. substances such as aldehydes, sugar or starch which prevent pptn. of Fe. The product is washed, dried, calcined and ground.

Paint remover. W. E. SEABORN, F. C. KENT and A. W. INGALL. Can. 263,840, Aug. 24, 1926. A paint remover consists of NaOH 85 lbs., CaC_2 6 lbs., bran 20 lbs., and water 30 gals.

Coated fabrics for floor covering, etc. C. M. TAYLOR. Brit. 243,614, May 16, 1925. A felt base with a flexible filling material is coated with paint and then with a cellulose acetate or nitrate compn. Cf. *C. A.* **20,** 272.

Linoleum. G. SCHICHT and A. EISENSTEIN. Brit. 242,832, Feb. 3, 1925. In the manuf. of linoleum from materials such as oil varnish, resin, wood meal and mineral coloring agents, the raw materials are mixed together in such proportions that the resulting mass is "just pulverulent," the mixt. is oxidized and additional quantities of the ingredients are added during or subsequent to oxidation.

Coating and polishing woodwork. S. DYHR. Brit. 242,478, Jan. 8, 1925. A celluloid-rosin soln. contg. more rosin than celluloid is first applied, followed by coats contg. a larger proportion of celluloid and finishing with a coat of pure celluloid which may be finished with pumice and methylated spirits.

Composition for simultaneously polishing and staining wood or similar material. E. DE VILLIERS. Brit. 242,760, Oct. 20, 1924. Paraffin, beeswax and turpentine are mixed with umber, lampblack, red oxide of Fe or other pigment, stain or dye.

Varnish composition for use as a primer. G. RUTH AKT.-GES. AND R. WEITHÖNER. Brit. 242,379, Aug. 28, 1924. $Al(OH)_3$ (or an Al salt and an alk. compd. which together will form $Al(OH)_3$) is added to a mixt. of rosin and linseed oil or wood oil, or may be added first to a resinic or fatty acid and the product then mixed with a drying oil. Turpentine may be added as a thinner and driers such as those contg. Pb and Mn may be used.

Cellulose acetate varnishes, etc. A. EICHENGRÜN. Brit. 243,031, Nov. 17, 1924. Coating compns. for fabrics and the like comprise solns. of acetone-sol. cellulose acetate or a mixt. of acetone-sol. and $CHCl_3$-sol. cellulose acetates, formed in the cold by soln. in CH_2Cl_2 together with MeOH or its homologs as a solvent, with or without other solvent or nonsolvent substances, such as acetone, formic and acetic esters, C_6H_6, ethylene chloride and triacetin, fillers, softening agents and the like. The compns. may be applied over nitrocellulose coatings.

Resinous compositions. E. SCHAAL. Brit. 243,556, Jan. 10, 1925. Resinic acid glycerol esters and colophony are rendered hard and suitable for use as substitutes for copal in the manuf. of varnishes and like products by powdering them, mixing with dehydrating and oxidizing agents and heating them in a current of air, O or steam to

a temp. below their m. p. Co acetate, Mn borate or resinate and anhyd. Na_2SO_4 and NaCl may be used in the treatment.

Synthetic resins. J. S. STOKES. Brit. 243,470, Sept. 9, 1924. Furfural or furfuramide is used with PhOH, cresol, resorcinol or naphthol to obtain a fusible resin which is subsequently hardened by use of furfural or a CH_2-contg. hardening agent. Jet-black resins are produced without addn. of any pigment and the products may be removed hot from a mold without impairing their glossy appearance. p-$C_6H_4(NH_2)_2$ may be used to accelerate hardening. Numerous details are given.

Rosin composition. MILLS NOVELTY CO. Brit. 243,288, Aug. 20, 1925. A rosin compn. for use on the bow-disk of an electrically played violin is formed of rosin mixed with 20% or less of sandarac, with or without addn. of a small quantity of linseed oil. Alc. may be used as a solvent in mixing the ingredients and then distd. off. An app. is described adapted for prepg. the mixt.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Polymerization during the drying and boiling of fatty oils. L. AUER. *Chem. Umschau Fette, Oele, Wachse u. Harze* **33,** 216–26(1926).—A critical review of recent literature. *Conclusions.*—Neither the mol. wt. detns., I nos., viscosity nor n are final proof for polymerization during the boiling of fatty oils or during their film formation. A final proof would be a demonstration of the presence of the 4 C atom ring and a mol. wt. detn. in a true soln. Formation of boiled oil and gelatinizing of wood oil are of a colloidal nature and are part of the phenomenon of a coagulation. The detn. of analytical consts. appears to be influenced not only by chem. structure but also by colloidal reactions. It seems improbable that a dimol. polymerization should occur in the presence of high mol. colloidal media. Many so-called polymerizations are probably a coagulation of an isocolloid of a lyophile nature. P. ESCHER

Oil bleaching experiments. R. NEU. *Z. deut. Oel- Fett-Ind.* **46,** 594(1926).—Exposure to light and boiling with solns. of salts of the Cu group plus SiO_2 bleaches soy-bean oil to a golden color, while raw linseed oil when heated with glucose to 240° and shaken with tannin soln. and pptd. with $SnCl_2$ bleaches to a light color. Derivs. of glucose do not act as well. P. ESCHER

The acetin and dichromate methods for glycerol analysis. W. PRAGER. *Z. deut. Oel- Fett-Ind.* **46,** 577–8(1926).—Comparative tests in glycerol analysis between the acetin and dichromate methods for a number of years show results that agree within less than 1.4%, only a few cases differing by more than 2%. The dichromate method gave the higher results. The cause of variations lies in the fact that in the dichromate method the glycerol is purified before analysis while in the acetin method it is not. The dichromate method also provides for a modified procedure when the total residue reaches a certain arbitrarily set limit. P. ESCHER

The fluorescence of oils in ultra-violet light. FRITZ CRONER. *Z. angew. Chem.* 39, 1032(1926).—A special Hg lamp is used which retains the rays visible to the eye and allows nearly pure ultra-violet rays to penetrate. Various vegetable and mineral oils were examd. and the following conclusions reached: (1) The various oils when placed in open dishes in the ultra-violet light show a characteristic fluorescence at the surface and a characteristic coloration of the oil itself. (2) A dark blue fluorescence on the surface indicates heating over 150° or (3) a mixt. of vegetable or animal oil with mineral oil. (4) An unclear color mixt. indicates a mixt. of various vegetable or animal oils. E. SCHERUBEL

Isopropanol as a substitute for ethanol. I. The determination of saponification numbers. H. A. SCHUETTE AND L. E. HARRIS. *J. Am. Pharm. Assoc.* **15,** 166–73 (1926).—Com. isopropanol was purified by distn., the fraction b. 81.3° (uncor.) being reserved. Solns. of KOH were made with purified EtOH and isopropanol as solvents. The sapon. nos. of 9 oils and waxes were detd. by the A. O. A. C. method, each KOH soln. being used. The values with propanol as solvent were substantially the same as those with EtOH. The advantages of using propanol in detg. sapon. nos. are the rapidity of sapon., freedom from aldehydes and the lack of legal restrictions in its sale. A glycerol-KOH soln. was prepd. by the A. O. A. C. method and a satd. soln. of KOH in propanol. Nine fats and oils were sapond. by each KOH soln. and the fatty acids sepd. and washed. The I no., m. p. and n_D of the fatty acids from each sample were detd. These consts. were essentially alike for each of the classes of oils. The general

conclusion is that isopropanol may be used as a solvent in place of EtOH for the prepn. of propanol-KOH. L. E. Warren

The lactone number. C. Stiepel. *Seifensieder-Ztg.* **53,** 617–8(1926).—Since the acetyl no. of fats and oils shows not only the OH groups of fatty acids, but also those of alcs. or uni- and diglycerides that might be present, the following method for the detn. of the "lactone-number" is proposed in its place, to indicate the presence of OH groups in fatty acids by the formation of inner anhydrides through loss of H_2O, thereby decreasing the acid no. but retaining the sapon. no.: Prepare the dry, free fatty acids of the sample by sapon. and acidification and det. the acid no. and sapon. no. to show complete sapon. Heat in a suitable flask to 250° for 2 hrs. and after cooling again det. the acid and sapon. nos. As a control heat again for 1 hr. to 250° and det. the acid and sapon. nos. to ensure completed lactone formation as shown by the constancy of these nos. The difference between the acid no. and sapon. no , divided by 2, gives the approx. amt. of lactones forming fatty acids contg. OH groups Results are also given of expts. in which the fatty acids had been re formed from these lactones by sapon. P. E.

Detection of hardened oils. J. Davidsohn and C. Streichhan. *Seifensieder-Ztg.* **53,** 551–3(1926).—D. and S detect hardened oils by Grun's method: Liberate the fatty acids from 2–5 g. of the fat, dissolve in hot 96% alc. and treat with a hot 96% alc. soln. of 1.5 g. Pb acetate Cool overnight and ascertain the presence of an excess of Pb soln. by adding some dil. H_2SO_4. Filter and wash with alc. until the filtrate remains clear when H_2O is added. Return the ppt into a flask with 100 cc alc., add 0 5 cc. glacial AcOH and boil. Cool to 15°, wash, crystallize the Pb soaps with alc and return again to the flask, washing with ether. Decompose the Pb soaps with dil. HNO_3 and ext. the fatty acids with ether Det their I no by the Hanus method. Tallows will show an I no. of 0.5, while hardened oils will show around 33 5 I no caused by the formation during hardening of solid isooleic acid. Attempts to shorten the method have failed. P. Escher

Stability of sulfonated oils toward acid, lime and magnesia. H. Pomeranz. *Seifensieder-Ztg.* **53,** 589(1926).—P. proposes the following criteria: For acid stability the soly. in dil. acids; for lime stability the formation of a compact soap that sinks to the bottom; for Mg stability the soly. of Mg soap in H_2O. P. Escher

Cajeput oil. D. B. Spoelstra. *Ber. Afdeel. Handelsmuseum Ver. Koloniaal Inst.* No. **25,** 3–8(1926).—Complaints have come in about cajeput oil having a low d., which causes difficulty in its sale. According to the literature, this is a normal variation, and no proof of an adulterated oil. A large no. of cajeput oils have been analyzed by S., especially with regard to the cineole content. For the last named the method of Schimmel was used. Petroleum and fats are used as adulterants, and can be easily detected. The soly. in 80% alc. is a good indication of a pure oil. It may be possible, with the help of this test, to eliminate the heaviest adulterated oils from the market. Tabulated results of analyses are given. J. C. Jurrjens

Deodorization of coconut oil. W. L. Brooke. *Philippine J. Sci.* **30,** 201–12 (1926).—Methyl nonyl ketone was isolated from the product obtained from the deodorization of coconut oil, thus confirming the finding of Haller and Lassieur. Its presence is established by the prepn. and identification of the oxime, dioxime and semicarbazone. Most of the unsapon. substances distil over in the first 4 hrs. of deodorization. The deodorization sludge from the factory analyzed as follows: moisture 20.25, lauric acid 26.3, ash 3.26%, sapon. no. 79.0. The unsapon. constituents also contain alc. compds. E. Scherubel

Identification of olive oils obtained by extraction with solvents. Stefano Pachini. *Giorn. chim. ind. applicata* **8,** 178–9(1926).—Olive oils obtained with solvents, and refined extn. oils, are easily identified even when present in small amts. in pressure olive oils, by means of the following reaction: Treat 2.–3 cc. of the oil in a test tube with an equal vol. of Ac_2O, heat and shake for a little while, cool and filter through a small filter moistened with Ac_2O. To the filtrate in a small porcelain dish add a few drops of concd. H_2SO_4: a cherry-red color soon develops. If a few cc. of H_2O are added to the product of the reaction, the liquid takes on a more or less intense green color, which, however, soon disappears. All olive oils ordinarily obtained from olive husks by extn. with solvents give the above color reaction. The reaction is still present in refined extn. oils and takes place even more clearly, because of the absence of chlorophyll and other disturbing impurities. This reaction permits differentiating between olive oils obtained by extn. with solvents from those obtained by pressure and from clear olive oils. Saccardi's test for sulfur oils (cf. *C. A.* **20,** 3243) generally gives negative results when applied to oils obtained from olive husks with CS_2. R. S. P.

The composition of the drying oils and their relations to the primary and secondary

umber. W. VAUBEL. *Farben-Ztg.* **31,** 2771–5(1926).—The primary ', from the amt. of Br directly absorbed by the oil. It corresponds inoleic and linolenic acid and their isomers. The linoleic acid can of the hexabromine number. The secondary Br number is calcd. of Br absorbed when used in excess. The difference between lary Br (I) numbers corresponds to the amt. of oleic acid present ~ oil. The iso- or β-linoleic acid reacts like oleic acid after the addition of 2 Br mols. The drying oils constantly change their constitution, whereby the Br (I) no. diminishes. Therefore the highest Br (I) no. ever found corresponds to the original character of the oil. V. reviews the composition and the I numbers of the following oils and compares his own figures with the figures found by others: sunflower, soy bean, poppy, rape, hemp, peanut, walnut, linseed, wood, whale and sardine oil. J. S.

Determination of fatty acids for customs purposes. H. HELLER. *Z. deut. Oel-Fett-Ind.* **46,** 148(1926).—The Czechoslovakia customs regulations give the following rapid method for detg. whether a fat contains more or less than 50% free fatty acids: Heat 5 g. of the sample with 50 cc. alc. until dissolved; cool, add a few drops of phenolphthalein and 5 cc. KOH soln. (65.45 g. per l.). If the soln. remains red after 15 sec., less than 50% free acids are present; if colorless, more than 50% are present. A calcn. on the above basis reveals the error that the 5-cc KOH soln. is equal to only 32.7% instead of 50% free acids as oleic acid. A corresponding change should be made in the directions to insure correct customs decisions. P. ESCHER

Synthesis of waxes. AD. GRÜN. *Z. angew. Chem.* **39,** 1037(1926).—The hydrogenation of ketones by the use of Ni catalyzers to form secondary alcs. yields hydrocarbons also. It has been found that the use of other metals than Ni and metal mixts. will give yields of 80–90% of the theoretical wax alcs. The elementary analysis of the substances are correct only if the substances are burned with CuO in a stream of O. The usual procedure gives results too low for C and H and ethylene is lost. By placing an absorption flask at the end of the app. contg. 0.05 *N* ICl in AcOH and titrating back with thiosulfate over 1% C_2H_4 was found. High mol. hydrocarbons and their O derivs split off O and olefins by heating under certain conditions. It is questionable whether a slight cracking is a source of error in the elementary analysis of high mol. substances. E. SCHERUBEL

The swelling constants of soaps. E. L. LEDERER. *Z. deut. Oel- Fett-Ind.* **46,** 497–9; *Seifensieder Ztg.* **53,** 534–6; *Z. angew. Chem.* **39,** 1007–9(1926).—Katz's formula for the relation between swelling pressure and swelling heat, $M_0dQ/Mdx = P_q = -(RT/M)\log_e h$, in which *R* is the gas const., *T* the abs. temp., *M* the mol. wt. of the liquid medium and M_0 the mol. wt. of the swelling substance, was applied to soaps in H_2O. The exptl. results agree only qual. with the calcd. results; the quant. figures vary on account of their small values. These small values leave also unexplained L.'s observation that soaps of various H_2O content, when mixed in bulk, may heat up to carbonizing. L. also calcd. the values for his "permanation" const. *viz*, that amt of H_2O which passes in unit time through a unit cross section per unit of length at a concn. difference of 1. This value is not proportional to the abs. temp. as required by theory, but is rather proportional to the centigrade temp., probably because of the cessation of mobility of the H_2O mols. at 0°. The permanation const. varies also with the speed of solidification of the soap. P. ESCHER

Problems in the soap industry, especially saponification in the autoclave. J. GROSSER. *Seifensieder Ztg.* **53,** 588, 602–3(1926).—A discussion of the advantages and disadvantages of boiling soap under pressure. The disadvantages predominate. P. ESCHER

Washing compounds containing sodium silicate. W. KIND. *Seifensieder Ztg.* **53,** 618–9, 633–4(1926).—The use of condensed H_2O in boiling and rinsing wash goods caused no fiber incrustation, the ash after 20 washings showing 0.12%, of which 0.08% is SiO_2, while tap H_2O of 12° hardness (German) showed 2.73% ash (0.23%, SiO_2) under the same treatment. P. ESCHER

The determination of borates in soaps. M. DITTMER. *Seifensieder Ztg.* **53,** 633 (1926).—An explanation is given for the calcn. of results in the method adopted as standard by the German Commission for Standard Methods (cf. *C. A.* **18,** 3731). P. ESCHER

The "alkali number" as a conventional method for the alkalinity of soaps. V. ISMAILSKII. *Z. deut. Oel- Fett-Ind.* **46,** 545–6, 562–4(1926).—Expts. on the detn. of free alkali in soaps lead to the following conclusions: The use of 50–60% alc. (Bosshard-Huggenberg method) causes Ba soaps to absorb varying amts. of alkali from different soaps, α-naphtholphthalein for dark soaps is not a better indicator than phenol-

phthalein; pptn. in the cold in the presence of silicates favors absorption of alkali; the exact detn. of free alkali in soaps is still an unsolved problem. After detg. the factors that cause variations in the results, such as concn., temp., amt. of washing, etc., I. proposes the following standard method of detg. the "alkali number:" Weigh up to 10 g. of the sample, freshly cut from the center, into a 400 cc. rubber-stoppered flask and dissolve in 20 times the wt. of boiled out H_2O; ppt. with twice the wt. of neutralized 30% $BaCl_2$ soln., rotating the flask; boil until the ppt. coagulates or, if soda or silicate is present, until it granulates, keeping the flask loosely stoppered up to this point. Cork tightly and cool under H_2O, opening once to relieve suction. Filter through a rapid filter into an Erlenmeyer flask and wash the ppt. still retained in the flask 3 times with a total of 10 times the wt. of cold H_2O. Titrate against 0.1 *N* acid and phenolphthalein; express the results in % NaOH. Examples of the constancy of results are tabulated for different soaps. Eschweger soaps show variable results on account of the difference in compn. of their marbled structure. A qual. test for alky. has also been worked out by I. and is described. The sensitiveness of the human skin toward alk. soaps is caused by the absorption of the alkali by the skin, followed by hydrolysis of its albumin. P. ESCHER

How I have been led to the direct hydrogenation method by metallic catalysts (SABATIER) 2.

Purifying oils and fats. METALLBANK UND METALLURGISCHE GES. AKT.-GES. and W. GENSECKE. Brit. 242,739, Sept. 17, 1924. In purifying oils or fats with steam *in vacuo* as described in Brit. pat. No. 222,093 (*C. A.* **19,** 1062), the steam and vapors from the extg. vessel are transferred by a steam injector which causes them to expand to an abs. pressure lower than that prevailing in the extg. vessel before their delivery to the mixing venturi of the injector. Other structural details are also specified. Cf. *C. A.* **19,** 3168.

Purifying vegetable oils. H. BOLLMANN. Brit. 243,643, May 15, 1925. Soybean oil or other vegetable oils are freed from phosphatides by treatment with an aq. soln. of $Ba(OH)_2$, which prevents the formation of an emulsion when the oil is subsequently treated with alc. to remove fatty acids.

Butternut oil. A. P. ELIADES. U. S. 1,602,004, Oct. 5. Whole butternut meats are soaked in brine, the brine is drained off and the nutmeats are roasted until they attain a rich brown color, comminuted, mixed with previously extd. butternut oil and H_2O and the mixt. is cooked to a pulp at its b. p., free oil is drained from the pulp and residual oil is pressed out of the pulp. The product is suitable for use on the scalp as a *therapeutic agent.*

Distilling apparatus for refining oils or fats. LEVER BROS., LTD., R. CRAIG AND C. E. C. SHAWFIELD. Brit. 242,316, May 9, 1924. An app. is described suitable for use in carrying out the process of oil- or fat-refining specified in Brit. pat. 224,928 (*C. A.* **19,** 1918).

Edible fat. H. A. NEWTON. U. S. 1,601,229, Sept. 28. Onions are cooked to a browned crisp condition in a vegetable fat such as peanut, cottonseed or soy-bean oil, mixed with hydrogenated cottonseed oil to form a product resembling chicken fat which has been rendered with onions.

Apparatus for sweating and crystallizing wax. BURMAH OIL CO., LTD., H. L. ALLEN and J. MOORE. Brit. 243,447, Aug. 29, 1924. Modifications of the app. described in Brit. pat. No. 208,195 are specified.

Soap. K. HAAS. Brit. 243,423, Aug. 22, 1924. In the sapon. of albumin and fats with excess alkali, the partial dissocn. of the proteins is interrupted by the addn. of CH_2O, paraformaldehyde or $(CH_2O)_3$ so that $(CH_2)_6N_4$ is formed and hardening of the soap is effected. Excess alkali is neutralized by freshly pptd. hydroxide of Al, Sn or Zn or by benzoic, formic or other org. acid. At least 15% of proteins is used.

Soap. W. SAECHTLING. Brit. 243,333, Nov. 24, 1924. Curd soap is bleached and refined after salting out by treating it first with a bleaching agent, such as a hyposulfite, having a reducing action, and then with another bleaching agent, such as a percarbonate or persulfate, having an oxidizing action.

Solid alcohol soap. R. FALCK. U. S. 1,601,224, Sept. 28. Brit. 242,444, Nov. 17, 1924. Soap almost completely freed from H_2O is heated with about 1.2 times its weight of strong alc. in a closed vessel at a temp. of 120° under a pressure of 6 atms. for $1^1/_2$ hrs.

28—SUGAR, STARCH AND GUMS

F. W. ZERBAN

Possible sugar loss in the pipe lines of slicing factories. P. MORIZOT. *Bull. assoc. chim. sucr. dist.* **43,** 83–5(1925).—Beet juice which had been limed at the rate of 10 g. of CaO per l. and had a sugar content of 12.51% (av. of 96 polarizations) was found on arrival at the central factory to contain 12.59% (av. of 48 polarizations), showing that the amt. of CaO stated suffices to conserve the juice during its normal transport in pipe lines. J. F. BREWSTER

Solubility of sucrose in impure solutions. J. ROBART. *Bull. assoc. chim. sucr. dist.* **43,** 128–32(1925).—With beet molasses contg. very melassigenic non-sugars, results were obtained showing that the soly. of sucrose is not affected by the presence of such substances. J. F. BREWSTER

Purifying molasses by addition of hydrochloric acid. G. DORFMÜLLER AND F. TÖDT. *Z. Ver. deut. Zuckerind.* **75,** 903–13(1925).—Addn. of HCl to molasses to neutralize the bases present and to obtain a more readily worked product, effects no actual increase in the purity value. If the soln. of molasses is dialyzed after the HCl addn., as in Cutler's method (*C. A.* **18,** 2084, 2821), the economy of the process becomes extremely doubtful. J. F. BREWSTER

Has the double crusher reason for its existence? FRANCIS MAXWELL. *Intern. Sugar J.* **28,** 357–63(1926).—The crusher should be regarded as a preparatory stage to milling, and to accomplish its purpose the cane must be torn into shreds. If this is not done, the 1st and sometimes even the 2nd mill must continue this preparatory work. It is sometimes claimed that extn. is increased by double crushing, but the expression of the juice from the cane should be done by the mill and not by the preparatory plant. The claim that double crushing is indispensable for capacity of milling, may be adequately answered by the record established at Central Vertientes in Cuba, of 5600 tons in 24 hrs., with a single crusher, followed by seven mills. W. L. OWEN

Fermentation of bagasse in relation to the yields of industrial alcohol. WM. L. OWEN AND NORMAN BENNETT. *Intern. Sugar. J.* **28,** 463–70(1926).—The rapidly increasing utilization of cane bagasse for the manuf. of fiber board, "Celotex," and the necessity of storing the baled bagasse as a reserve supply during the yr., have introduced a problem of preserving this material from deterioration in storage. Since the residual sugars in the bagasse tend to hasten its deterioration, their removal by fermentation into alc. might prove economically feasible. The sugars in baled bagasse did not ferment very readily, and the addn. of the bagasse to a molasses wort tended to depress the yield of alc. and to lower the efficiency of the fermentation of the sugars in the molasses. However, a bagasse which was first extd. with H_2O and then treated with a sugar soln. comparable in compn. to a cane juice, did not depress the yield of alc. from a molasses wort, and the overall efficiency of the mixt. of bagasse and molasses soln. was practically as good as on the molasses alone. This indicates that with fresh bagasse satisfactory yields of alc. could be obtained. W. L. OWEN

Effect of boiling on color. F. HOFFMANN. *Sugar* **28,** 266–8(1926).—The increase in color from thick juice to run-off was studied. Measurements were made in a polarization photometer with a double blue filter. Boiling caused an increase in color, averaging 47%. C. H. CHRISTMAN

Rational regulation of the boiling house. L. W. HOFLAND. *Arch. Suikerind.* **34,** 697–705(1926).—The boiling scheme proposed by Van Nes (*C. A.* **20,** 3915) is criticized. A scheme based on former recommendations (*C. A.* **16,** 1516) is outlined, and this is claimed to be superior to Van Nes' both from the standpoint of the removal of nonsugars and that of the time during which the products are exposed to high temp. F. W. ZERBAN

Exhaustive graining of sirup by drawing in a series of run-offs of gradually descending purity. G. E. VAN NES. *Arch. Suikerind.* **34,** 706–7(1926).—Reply to Hofland (cf. preceding abstr.) refuting his arguments. F. W. ZERBAN

Reconditioning damaged sugar. C. W. LADD. *Sugar* **28,** 307–9(1926).—A warehouse contg. granulated sugar burned. A portion of the sugar was not damaged. The balance was dissolved, limed with 10% lime and carbonated. After filtration it was sulfured and sent through the effects. It was sulfured again and filtered and then sent to the pan. The total cost per bag was $0.684. C. H. CHRISTMAN

The chemistry of refining by "Norit." P. HONIG. *Intern. Sugar J.* **28,** 302–6 (1926).—One of the most significant results of the "Norit" treatment of sugar melts from washed Cuban sugars, is the increase of the surface tension of the liquor. Fil-

tration with Filter-Cel slightly increases the surface tension, while Norit not only removes color, but greatly increases the surface tension of the filtrate. The colloids depressing surface tension are the greatest source of trouble to the refiners, because they not only interfere with crystn., but are indirectly melassigenic. The surface-tension measurements were made with a DeNouys app., with the liquor diluted to 30 Brix. Pure sucrose at 20° gave 74.75 dyn./cm. while H_2O gave 72.65. Norit-treated washed sugar melt gave 72.74. W. L. OWEN

Refining qualities of raw sugars. T. B. WAYNE. *Planter and Sugar Mfr.* **77,** 247–50(1926); cf. *C. A.* **19,** 3610.—The nature of the soil influences the quality of the sugar in Cuba. Clarification practice varies in different centrals and the resulting sugar may contain colloids which reduce refining yields. Gums and non-settling matter reduce filtration rates. Uniform crystals facilitate affination and reduce losses from yeast, bacteria and fungi. Moisture should be low. Factors other than polarization should be standardized in the grading of sugars, giving high-grade sugars a premium and low-grade sugars a penalty. C. H. CHRISTMAN

Decolorizing carbons: their value in sugar refining. A reply to Suchar Process Corporation. A. A. BLOWSKI AND J. H. BON. *Intern. Sugar J.* **28,** 367–70(1926).—A reply to Wickenden (*C. A.* **20,** 1336). W. L. OWEN

Standardization of Louisiana cane products. I. H. MORSE. *Planter and Sugar Mfr.* **77,** 188–90(1926).—Specialization upon the production of a uniform grade of sirup is urged as being the solution of low returns from Louisiana cane. A demand for high-grade sirup exists and its production would increase the returns to the factory. C. H. CHRISTMAN

Some analytical studies on sugar cane grown in Florida. J. McW. LEMON. *Planter and Sugar Mfr.* **77,** 167–70(1926).—D 74 and Crystalina cane were analyzed at intervals from Sept. 19 to Feb. 6. D 74 shows a higher sucrose and reducing-sugar content throughout the test. C. H. CHRISTMAN

A study of cane burning before cutting. C. ALINCASTRE. *Sugar News* **7,** 272–85 (1926).—Burned uncut cane suffers losses similar to cut cane. Purities in burned cane drop at the same rate as in cut cane. Losses occur after 24 hrs. which offset the decreased harvesting cost. Rupture of the rind permits loss of sap and decompn. by microorganisms. Burning is warranted only when harvesting costs are excessive, or when immediate milling is possible. C. H. CHRISTMAN

Experiments with sugar canes on the estates of the Ste. Madeleine Sugar Co., Ltd. G. A. JONES. *Intern. Sugar. J.* **28,** 291–6(1926).—The purpose of these expts. was to det. the variety of cane best suited to the various types of soils in Trinidad. On the brown and red soils only the Uba canes give satisfactory ratoons. On the black soils the plant canes give larger returns than the 1st ratoons, but on the alluvial soils the latter approach the former in yield. The Uba cane is gaining in favor for use on poor lands, as a means of bringing them into such a condition that other varieties may be grown upon them. In manurial expts. 20 tons of pen manure per acre gives an increase of 7.8 tons of cane, or 23.7%, which is more than 9 times the error of the difference, and hence is statistically significant. As the manure is worth 8–10 shillings per ton, and the increase in cane from 5–7 £, the manure does not pay for itself on the plant cane. W. L. OWEN

The determination of the hydrogen-ion concentration in the cane-sugar industry. LOUIS BAISSAC. Mauritius, *Bull.* No. 10; *Intern Sugar J.* **28,** 370–4(1926); cf. *C. A.* **20,** 2258.—The various methods of p_H detn. are discussed and the practical application of such detns. to cane-juice clarification is described. The range of p_H between the danger point of inversion, and of reducing-sugar destruction, is very narrow, especially where the soln. is of low sp. gr. and where it is subjected to high temps. By p_H detns. at successive stages of sugar manuf., both of these dangers may be avoided. W. L. OWEN

Juice from the time it leaves the milling plant until it reaches the evaporator supply. J. N. S. WILLIAMS. *Planter and Sugar Mfr.* **77,** 207–8(1926).—Juice after leaving the mills is screened, limed, heated and passed through intermittent settlers. The Petree process reintroduced continuous settling. p_H control at the liming station has standardized this step. Greater removal of material causing turbidity and color is required and this will be followed by lower molasses yields. C. H. CHRISTMAN

The p_H with quinhydrone electrode. L. E. DAWSON. *Sugar* **28,** 211–4, 262–4, 310–2(1926).—This method has the advantage of giving correct readings, without delay for equil. in the H^+ electrode. With care it can be used in solns. up to p_H 9.0. In solns. with low buffer effect, results may be incorrect. High salt concns. introduce errors. Strong oxidizing and reducing agents cause unreliable results. Reference

should be made to the original article for description of electrode and operating conditions. A calomel cell, quinhydrone electrode or soln. of known p_H is used as a reference. Various factors affect the p_H detn. Diln. causes an appreciable change. In clarified juice this may be small but in heavy juice, where inversion may be greater, the effect of diln. is greater. SO_2 causes errors which cannot be avoided unless the SO_2 is removed. High-purity juices have low buffer action and are susceptible to the effect of CO_2. A complete bibliography is given. C. H. CHRISTMAN

Occurrence of gentiobiose in the products of the commercial hydrolysis of corn starch. HENRY BERLIN. *J. Am. Chem. Sci.* **48,** 2627–30(1926).—Gentiobiose has been identified through the isolation of its β-octaacetate in pure, cryst. form, as 1 of the constituents of the mother liquor ("hydrol") obtained in the com. manuf. of cryst. *d*-glucose. By a comparison of phys. and chem. properties, it is shown that the unfermentable part of hydrol, while closely resembling isomaltose, contains only a comparatively small amt. of gentiobiose (5–6%) and criticism is therefore made of applying the name isomaltose to a product that apparently consists of a mixt. of carbohydrates. C. J. WEST

The hydrolysis of starch by acids. D. R. NANJI AND ROBT. G. L. BEAZELEY. *J. Soc. Chem. Ind.* **45,** 215 9T(1926).—P apparently plays an important role in the acid hydrolysis of starch. The complicated nature of the hydrolysis is emphasized and diagrams showing the numerous steps in the hydrolysis of both amylose and amylopectin are given The difficulty of studying the hydrolysis is further increased by the lack of an entirely satisfactory method of analysis. The authors developed a *method for detg. dextrin, isomaltose, maltose and dextrose* and compared the results so obtained with those by Allen's and Ling's methods. A. W. KENNEY

The effect of progressive doses of Chile saltpeter on the sugar beet (SOUČEK) **15.**

29—LEATHER AND GLUE

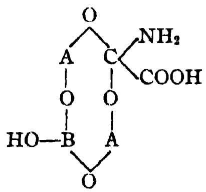
ALLEN ROGERS

The strugglings and strivings of science in the industries, with particular reference to chemistry in the leather industry. ETTORE ANDREIS. *Gerber* **52,** 85 *et seq.* (1926).—An address, dealing chiefly with the early development of leather chemistry. H. B. MERRILL

Recent advances in the chemistry of leather manufacture. DONALD BURTON. *Leather Trades Year Book* **1926,** 41–9.—A review. H. B. MERRILL

Heat economy in the leather industry. CHR. EBERLE. *Collegium* **1926,** 342–9.—Heat requirements for power, heating and leather drying are discussed. I. D. C.

Biochemical problems in leather manufacture. V. SADIKOV. *Westnik, Bote des Allrussischen Ledersyndikates* **1926,** No. $^2/_3$; *Collegium* **1926,** 356–63.—A lecture. X-ray measurements of collagen crystals indicate that it has a mol. wt. of 685. Its structure, from Dakins results, is probably



, where A is an anhydride of cycloglycylalanine, B of cycloprolyl- (or oxyprolyl)-leucine and C cycloasparagylarginine (or lysine). The —CO—NH— or C(—OH)=N group is absent (ninhydrin test). During gelatinization collagen loses its cryst. structure and the mol. becomes more complex because of hydration and condensation. From pancreatin "collagenase" can be prepd. and this will break up collagen and vegetable- or chrome-tanned leather to amino acids. Enzyme action may produce a condensed, resistant form of collagen which retains the micellar structure and which is not acted on by collagenase or pepsin prepns. I. D. C.

Finishes and the modern finishing of leather. MARCEL GILLET. *Cuir tech.* **15,** 114–6(1926).—Discussion. H. B. MERRILL

A leather industry in Spain. M. A. R. PANIKER. *Leather Trades Year Book*

1926, 60–79.—A very full discussion of methods employed in primitive and modern tanneries in Spain. H. B. Merrill

Action of acids on leather. A. Deforge. *Halle aux cuirs* **1926,** 267–71.—A review of recently published work. H. B. Merrill

The role of oxidation in leather manufacture. W. R. Atkin and F. C. Thompson. *Leather Trades Year Book* **1926,** 56–8.—It has been shown that sulfides used in *unhairing* attack the keratin mol. at the cystine group. The reaction is presumably a reduction to cysteine. It is suggested that the cysteine then acts as an O_2 carrier, being oxidized by atm. O_2 and in turn oxidizing the cells of the epidermis, thus facilitating unhairing. The *rotting of leather* is considered more a matter of oxidation than of acid hydrolysis. The leathers which deteriorate most frequently contain either Fe or catechol tannins, both of which are O_2 carriers. H. B. Merrill

Oils and fats for leather use. S. Salm. *Ledertech. Rundschau* **18,** 182–3(1926). I. D. Clarke

Technical standards (averages) in the manufacture of sole leather. A. M. Goldenberg. *Collegium* **1926,** 364–74; cf. *C. A.* **20,** 1534.—Tables are given showing the relation to each other of the fresh hide wt., green salted wt., soak wt., white wt. and the wt. of leather. The data are based on several hundred thousand hides. I. D. C.

Hide and leather defects and their causes. R. Lauffmann. *Ledertech. Rundschau* **18,** 47–52, 62–7, 75–9, 86–91, 104–6, 110–3, 126–7, 135–8, 151–3, 161–3, 170–4, 183–5 (1926).—An alphabetical list of defects is given with definitions, etc. I. D. C.

Extraction of chromium from leather by means of sodium potassium tartrate. II. Nikolaj Ivanovic Berestovoj and Liboslav Masner. *Cuir tech.* **15,** 398–400(1926); cf. *C. A.* **19,** 3385.—To supplement previous work on extn. of Cr by Na K tartrate, the extn. by acids and alkalies was studied. Removal of Cr from leather appears to be at a min. at and near the isoelec. point. H. B. Merrill

Cause of "gulf" disease. Pietro Biginelli. *Giorn. chim. ind. applicata* **7,** 568–71(1925).—In the putrefaction of the putrid waters used in freshening arsenical skins there is developed, together with NH_3, CO_2 and H_2S, also AsH_3, or more probably an org. sulfoarsine. The waters of the Danzig Gulf, especially where they receive the refuse waters from the cellulose factories nearby, approximate qualitatively to the waters resulting from freshening arsenical skins. The cause of the poisoning of workers in French tanneries, as well as of the fishermen in the Danzig Gulf, is probably attributable to the slow and relatively continuous absorption of AsH_3 or org. sulfoarsine. Robert S. Posmontier

Different leather varnishes. Hans Hadert. *Ledertech. Rundschau* **18,** 169 (1926).—Formulas are given for varnishes of various colors. I. D. Clarke

The chemist at the tannery. Boris Monsaroff. *Canadian Colorist & Textile Processor* **6,** 242–3, 266–7, 276(1926).—A non-technical discussion of the role of the chemist in the tanning industry. Chas. E. Mullin

Mechanism of chrome tanning. S. Hilpert and E. Schlumberger. *Collegium* **1926,** 349–55.—See *C. A.* **20,** 3245. H. G.

Chemical nature of vegetable tanning. A. W. Thomas. *J. Am. Leather Chem. Assoc.* **21,** 487–516(1926).—Review of the modern work on chemistry of the proteins and tannins and on the combination of tannin with collagen and deaminized collagen, showing that the combination is chemical in nature and indicating certain fundamental principles in tanning practice. J. A. Wilson

Physical and chemical properties of vegetable-tanned insole bellies. V. Wear resistance. D. Woodroffe. *J. Intern. Soc. Leather Trades Chem.* **10,** 266–72(1926); cf. *C. A.* **19,** 2143.—In general an increasing degree of tannage indicates a decreasing resistance to wear, which is also a function of the water-sol. content of the leather, a max. resistance occurring with a water-sol. content of 18 to 24%. J. A. Wilson

New tanning and auxiliary materials for the leather industry. Leopold Pollak. *Ledertech. Rundschau* **18,** 179–82(1926).—A description of artificial bates, syntans, etc. I. D. C.

What role will be played by colloidal grinders in the preparation of vegetable tanning materials for the tanning of skins? U. J. Thuau. *J. Intern. Soc. Leather Trades Chem.* **10,** 258–63(1926).—See *C. A.* **20,** 3095. H. B. Merrill

Micro-tannology. F. O'Flaherty, *et al.* *J. Am. Leather Chem. Assoc.* **21,** 516–9 (1926); cf. *C. A.* **20,** 2761.—Discussion. J. A. Wilson

Lime for the tannery. Dohogne. *Bourse aux cuirs de Liege* **1925;** *Cuir tech.* **15,** 416–7(1926).—The best results are obtained with a "fat" lime contg. 90–95% CaO. Methods of analysis are given. To prevent carbonation, the lime should be slaked

in a suitable tank as soon as received. A crust forms on the resulting paste, preventing further carbonation. H. B. MERRILL

The application of filtered ultra-violet light for the identification and differentiation of artificial and natural tanning materials. O. GERNGROSS, N. BAN AND G. SANDOR. *Z. angew. Chem.* **39,** 1028–32(1926).—Analytical aspects previously reported (*C. A.* **20,** 517, 1535) are reviewed. The work of Meunier (*C. A.* **19,** 2758, 3034) on the fluorescence of cellulose dipped in solns. of tanning materials is repeated and somewhat extended. The fluorescing substance of pine, larch and maletto occurs in the living bark, from which it is easily extd. by cold H_2O or warm EtOH or $(CH_3)_2CO$. The substance is irreversibly absorbed by cellulose in acid or neutral soln.; it is extd. from the cellulose by alkali. It is believed to be a deriv. of fisetin. H. B. MERRILL

Reducing agents used in the tannery. L. CREUX. *Cuir tech.* **15,** 397-8(1926).—Description of the manuf. of sulfites and related compds. H. B. MERRILL

The determination of the degree of tannage by means of the "hot-water test." The influence of drying on the hot-water resistance of hide powder. OTTO GERNGROSS AND REINHOLD GORGES. *Collegium* **1926,** 391–7.—The water resistance, *WB*, is detd. by heating, for 7 hrs. in a boiling H_2O bath, an amt. of leather contg. 1 g. dry hide substance with 80 cc. H_2O in a 100 cc. flask. Stirring may be continuous or 15 min. per hr. A stirring device is described. After 7 hrs. the soln. is made up to 100 cc. with boiling water, and filtered through linen. N is detd. in the filtrate and calcd. to hide substance. WB = undissolved hide substance × 100 hide substance in untreated leather. The *WB* of hide powder was raised from 2 to 7 by soaking at p_H 6, then air drying, while on drying 24 hrs. at 110° it was raised to 41. I. D. C.

Quantitative study of the influence of hydrogen-ion concentration and of neutral salts on the intensity of formaldehyde tanning. OTTO GERNGROSS AND REINHOLD GORGES. *Collegium* **1926,** 398–407.—Hide powder was tanned in 0.95% HCHO solns. adjusted to different H-ion concns The *WB* (cf. preceding abstr.) of the tanned powder increased gradually from 10 to 30 as the p_H rose from 3 to 6; it then rose abruptly to 70, at p_H 6 to 7; and was const. at 80 from p_H 8 to 12. There was no break at the isoelec. point In the acid region 0.75 satd. NaCl soln. did not change the tanning intensity or *WB*, but in the alk. region, 0.75 satd. NaCl, *N* and 0.1 *N* KCNS solns. decreased the *WB* appreciably. In concd. NaCl solns., sheep skins were not tanned in the acid but were well tanned in the alk. region. Poor leather is produced in strongly alk solns because of swelling and case hardening and not because of decreased combination of collagen and HCHO. Egg yolk, which greatly improves HCHO-tanned sheep skin, does not change the *WB*. I. D. CLARKE

X-ray spectrographic investigations of the heat contraction (so-called "Schnurren") of untanned and formaldehyde-tanned tendons. O. GERNGROSS AND J. R. KATZ. *Kolloidchem. Beihefte* **23,** 368–76(1926).—Untanned tendons shorten and swell at 67–68° and on subsequent cooling regain part of their former length. Formaldehyde-tanned fibers require at least 85°, contract less and show a greater expansion on cooling. Chrome-tanned fibers do not show these phenomena. X-ray spectrograms of the shrunken tendons (both untanned and formaldehyde-tanned) show the typical diagram for unexpanded gelatin, and on expanding to original length the collagen diagram of the original tendon is given. A partly chrome-tanned tendon also gave the gelatin diagram after shrinking. This evidence confirms Knapp's theory that the tanned fibrils remain sepd. after contraction while untanned fibrils cling. R. W. RYAN

A method for determining the enzyme value of artificial bates. V. KUBELKA AND J. WAGNER. *Gerber* **52,** 73 *et seq.*(1926).—The Fuld-Gross method for detg. the activity of a trypsin upon casein, slightly modified, is described. H. B. MERRILL

Extraction of shumac for analysis. Comparison of various methods. J. G. PARKER AND L. WINCH. *J. Intern. Soc. Leather Trades Chem.* **10,** 272–80(1926).—Discussion of the effect and relative convenience of varying minor factors in the official method of tannin analysis. J. A. WILSON

Methods for treating and evacuating tannery sewage. JACQUES NOYER. *Halle aux cuirs* **1926,** 272–5; *J. Intern. Soc. Leather Trades Chem.* **10,** 263–6(1926).—See *C. A.* **20,** 3096. H. B. MERRILL

Treatment of packing-house, tannery and corn-products wastes (MOHLMAN) **14.**

Leather. R. H. PICKARD, D. JORDAN LLOYD and A. E. CAUNCE. Brit. 243,438, Aug. 27, 1924. Stuffed leather is made by steeping Cr-tanned leather in the wet-blue condition in a bath of acetone, or spraying it with acetone, until the H_2O content of

the leather is reduced to 14–20%; the acetone is removed and the leather is treated with a stuffing material.

Decorating artificial leather, etc. C. A. HARNDEN. Brit. 243,152, Nov. 11, 1924. Artificial leather, "leather-cloth" or like material is coated with pyroxylin soln. which may be colored, then embossed and marked with a sponge dipped in a pyroxylin soln. of a different color from that first applied, rubbed and again embossed.

Coating fabrics in imitation of leather. H. F. V. MEURLING. Brit. 242,537, May 13, 1925. A fabric such as cotton flannel is coated with a soln. of rubber in C_6H_6 or other solvent to which talc, MgO, Al or Zn has been added, the impregnated product is treated with alc. and is pressed, ground and polished.

Dressing for leather belts. A. KRUEGER. U. S. 1,603,122, Oct. 12. Raw linseed oil 10, chlorinated lime 10–15 parts and smaller quantities of $CaCO_3$ and a volatile terpene oil are used together.

Tanning. R. H. PICKARD, D. JORDAN LLOYD and A. E. CAUNCE. Brit. 243,089, Aug. 27, 1924. A dehydrated skin is treated with a tanning agent in gaseous form, *e. g*, CH_2O, AcH, Br or Cl. Dehydration may be effected by treatment of the skin with acetone. Brit 243,090 specifies treating wet skins with acetone until, if dried at a temp. of about 57°, the pelt will immediately wet back in H_2O or until the pelt is in equil with a mixt. of acetone and H_2O of sp. gr. not greater than 0 81. The acetone is then evapd and the pelt treated with an aq. soln. of tannin. Brit. 243,091 specifies producing a Cr tanned leather that can be wet back by dehydrating the leather from the wet-blue condition by use of acetone

Tanning. J. K. TULLIS. U. S. 1,603,169, Oct. 12. Hides are treated with an aq. soln. of a Cr salt such as $Na_2Cr_2O_7$ 2, $MgSO_4$ 5, and $Al_2(SO_4)_3$ 4 parts.

Combined tanning and dyeing of leather. L. A. JORDAN. Brit. 243,144, Oct. 31, 1924. Dyes such as Quinoline Yellow, Quinoline Yellow K. T., Disulphine Green and Neptune Green, capable of substantially withstanding the bleaching action of SO_2 and sol. bisulfites, are used with tanning materials such as those prepd. from quebracho, mimosa or kahua, in proportion such that the dye "neutralizes" the undesirable color which otherwise would be produced by the tanning agent alone. $NaHSO_3$ or synthetic tannins may be added.

Glue. G. H. OSGOOD. U. S. 1,601,506, Sept. 28. A glue adapted for use on wood, *e. g*, in veneer work, or other materials is formed from peanut meal 100, borax 3, NaOH 2, $KMnO_4$ 1.5, $Ca(OH)_2$ 15, $CuSO_4$ 8, $CaCl_2$ 3 and Na silicate 50 parts, mixed in H_2O. U. S. 1,601,507 specifies cotton seed meal instead of peanut meal in a similar mixt.

Synthetic rubbers. LIPA SLOÏM. *Rev. gén. caoutchouc* **1926,** No. 20, 13–4; No. 21, 8–11; No. 23, 3–6; No. 24, 3–7; cf. *C. A.* **20,** 1728.—Historical, including the polymerization of hydrocarbons to rubbers, syntheses of isoprene and butadiene and their properties. C. C DAVIS

Has the synthesis of rubber already been accomplished? J. R. KATZ. *Kolloidchem. Beihefte* **23,** 344–8(1926).—It is considered that the failure of any type of synthetic rubber to give a crystal x-ray spectrum when elongated (cf. *C. A.* **19,** 2144) is sufficient evidence that it differs fundamentally from natural rubber. Further expts. with various types of synthetic and natural rubbers confirm these facts, and since a true synthetic rubber must consist of a polyprene which has on stretching a fiber structure and an x-ray diagram like natural rubber, it can only be concluded that natural rubber has not yet been duplicated synthetically. C. C. DAVIS

Further advances in the theory of the needle-shaped rubber molecule. E. LINDMAYER. *Gummi-Ztg.* **40,** 2805–7(1926).—The hypothesis has already been advanced (*C. A.* **20,** 3096) that the rubber mol. is needle-shaped, and the properties of raw rubber under various conditions were explained in terms of this theory. In the present paper, unsupported as before by direct exptl. evidence, the needle theory is utilized to ex-

plain other phenomena encountered in raw rubber and the properties of vulcanized rubber. Among the subjects discussed are the mol. structure of raw rubber before and after disaggregation through mastication, the crit. (transition) point of raw rubber, the Joule effect, the mechanism of acceleration, the bending of hard rubber, the aging (oxidation) of soft rubber and the regeneration of rubber. Besides the determinant influence of the needle structure on the phys. properties, the latter are influenced by changes from larger to smaller mols. and *vice versa*, thus: $(C_5H_8)_{12} \rightleftharpoons (C_5H_8)_6 \rightleftharpoons (C_5H_8)_3$. Vulcanization in the ordinary manner is assumed to yield the *compd.* $(C_5H_8)_6$.-$S(C_5H_8)_6$, the chem. satn. of which is the same as the original C_5H_8 nuclei in the raw rubber, since treatment with Axelrod-Bude reagent shows an unchanged Br absorption.
C. C. DAVIS

X-ray contributions to the analysis of the structure of rubber and allied materials. GEO L. CLARK. *Ind Eng. Chem.* **18,** 1131–6(1926) —A crit. review and discussion of the applications of x-rays to the study of the structure of rubber and of similar substances. Accompanying this survey of present developments are references to completed and to uncompleted work of the author on the *structure of C black, rubber, balata, gutta-percha, gelatin, collagen, glue, shellac,* other *proteins* and *resins* and *linseed oil* under different conditions. It has been found that C blacks vary in structure from practically amorphous to definite graphitic crystals. Repeated expts. failed to give evidence of the existence of the rubber crystals reported by Pummerer and Koch (*C. A.* **18,** 3737). On the other hand the x-ray measurements of Ott (*Naturwissenschaften* **14,** 320(1926)) were almost exactly duplicated, and from these it was calcd. that the *max formula of rubber* is $(C_5H_8)_6$. Based on the theoretical deductions of Polanyi and on the x-ray diagram of stretched rubber, calcns. show the "*unit rubber crystal*" to be $(C_5H_8)_4$, or if the factor 2 applies to 1 dimension, to be $(C_5H_8)_8$, a simple structure compared with the high polymerization ordinarily assumed. Unlike rubber, balata is cryst. under all conditions, though amorphous material is also present, and x-ray analysis indicates that its unit cell contains 4 mols. The structure is, however, distinctly different from that of rubber. Calcns. in connection with balata emphasize the uncertainty of d. measurements, since the system is 2-phase and since the packing in org crystals is not close. Like balata, gutta-percha has a cryst. structure before stretching, but its structure differs from that of balata and of rubber. Calcns. based on provisional data show the max. no. of mols in the unit cell to be 12, whereas based on its d. this value becomes 8. Gelatin, collagen, glue and other proteins show an amorphous structure before stretching and evidence of a crystal-like phase when stretched. The order of magnitude of the unit cells is probably the same as for rubber. Shellac shows evidence of both cryst. and amorphous phases, but on heating in an inert atm. the cryst. phase disappears.
C. C. DAVIS

The structure of elongated rubber samples. II. E. A. HAUSER AND H. MARK. *Kolloidchem. Beihefte* **23,** 64–78(1926).—A review of all the theories of rubber structure in the light of recent x-ray investigations. As a result of this survey H. and M. continue to regard their own theory, already published elsewhere (*C. A.* **20,** 3360), as the most valid one.
G. L. CLARK

Artificial aging tests on plantation rubber. ANON. *Bull. Imp. Inst.* **24,** 209–19 (1926).—See *C. A.* **20,** 2428.
A. PAPINEAU-COUTURE

Investigations on the role of the albumin of Hevea latex. J. GROENEWEGE. *Mededeel Alg. Proefsta. Landb.* [*Nederland.-Indië*] **20,** 1–25(1924); *Botan. Abstracts* **15,** 630.—A discussion of the significance of albumin in connection with coagulation ripening, and permeability and drying. The role of enzymes in coagulation is also discussed.
H. G.

Rubber as a dispersion medium. H. POHLE. *Kolloid-Z.* **38,** 75–6(1926).—The irregularity with which, in practice, fillers are dispersed in rubber is discussed. A prominent contributory cause is the tendency for very fine powders to "pack" to form secondary particles which are often exceedingly resistant to disintegration. Measurement of the light absorption of thin films of rubber-filler mixts. gives useful information about the degree of dispersion of the latter, and the progress of the mixing process.
B. C. A.

***p*-Nitrophenol as a preventive of mold on sheet rubber.** T. E. H. O'BRIEN. *Trop. Agr.* (Ceylon) **65,** 333–5(1925).—Soaking rubber in 0.1% solns. and subsequent drying were entirely satisfactory in preventing mold. There was no chem. reaction or change in appearance of the rubber.
A. L. MEHRING

Aggregation and reaggregation of crude rubber in the presence of other materials. M. KRÖGER. *Gummi-Ztg.* **44,** 2429–30(1926); cf. *C. A.* **20,** 2430.—The effect of nonrubber substances on the state of aggregation and on the reaggregation of rubber was

studied by following the progressive changes in phys. properties on long standing. By detg. the effect of the natural resins on the one hand and of powders such as C black and MgO added artificially on the other, the influence of widely different types of non-rubber substances was ascertained. A high natural-resin content (over 4%) retards the reaggregation of rubber as judged by tests of samples stored for 5 yrs. C black in small proportions has a retarding effect which is more pronounced the poorer the grade of black. In small quantities the better grades retard reaggregation and in large amts. accelerate it, a phenomenon analogous to the coagulation of kieselguhr or of W hydroxides by concd. HCl (cf Kröger, *C. A.* **16**, 1525). MgO retards reaggregation and the finer the particles, the greater this retardation. Piperidine accelerates reaggregation, a phenomenon which may be in some way related to its accelerating action in vulcanization. PER K. FRÖLICH

Importance of particle character in a rubber "pigment." D. F. TWISS. *Trans. Inst. Rubber Ind.* **2,** 78–84(1926).—A review and discussion, with 20 references to closely related work. C. C. DAVIS

The influence of particle size in rubber manufacture. S. S. PICKLES. *Trans. Inst. Rubber Ind.* **2,** 85–8(1926).—A general discussion. The only new work is a report of an *x-ray examn. of acetylene black, American gas black and oil black,* all of which showed the same character and probably consisted of mixts. of cryst. and amorphous C, with the cryst. structure in the highest proportion in the acetylene black. C. C. DAVIS

Particle shape. PHILIP SCHIDROWITZ. *Trans. Inst. Rubber Ind.* **2,** 89–91 (1926) —A brief discussion of the principles underlying the influence of particle shape on the phys. properties of rubber. The phenomenon of tearing is due to an alignment of anisotropic particles (cf. Vogt and Evans, *C. A.* **17,** 3807). For this reason any process of manuf which, unlike calendering, distributes the particles in a heterogeneous manner in the mastic results in a vulcanized rubber with diminished tendency to tear. Thus a rubber mixt. prepd. by spraying a suspension of colloidal clay in vulcanized latex and heating under pressure yielded a product which could be regarded from a practical point of view as non-tearing. C. C. DAVIS

Particle size effects in rubbers subjected to repeated stress. T. R. DAWSON. *Trans. Inst. Rubber Ind.* **2,** 92–5(1926).—Though much work has been done on the influence on the phys. properties of vulcanized rubber of reënforcing fillers, their influence on rubber subjected to repeated stresses has not been studied quantitatively. To obtain information on this point the phys. properties of rubber-S mixts. contg. equal vols. of fillers (20 vols. per 100 vols. of rubber + S) were detd. before and after repeated stressing. All fillers tested, *viz.*, barytes, ZnO (colloidal and ordinary), clay, light Mg carbonate, lamp black, gas black and gas black + pine tar, increased the energy loss (hysteresis after a definite no. of cycles at 150% elongation), in general the finer the particles the greater this loss. The losses were, however, relatively small with ZnO, probably because of its heat cond. No significant increase in vol. occurred after 1300 cycles at 150% elongation. C. C. DAVIS

The influence and elimination of coarse particles. NÖEL HEATON. *Trans. Inst Rubber Ind.* **2,** 96–9(1926) —A discussion of the particle size of paint and rubber pigments and tests available for measuring this property. Experience has shown that in classifying pigments it is convenient to group their particles in 3 sizes: *coarse,* diam. over 60 microns, *intermediate,* diam. 10–60 microns and *fine,* diam. under 10 microns. In the manuf of paint, the intermediate particles have a disturbing influence on the product, interfering with the flow, causing speckiness and rendering the dispersion unstable. In rubber their detrimental influence is still greater. C. C. DAVIS

The value of a direct measurement method for particle-size determination. HENRY GREEN. *Trans. Inst. Rubber Ind.* **2,** 107–15(1926).—A direct or photomicrographic method for detg. the particle size of a pigment has the advantages over other methods that it gives a distribution curve (particle size *vs* frequency) and does not always require the assumption of a cubical or spherical particle. From the distribution curve all necessary data can be obtained for calcg. the av. diam. It is particularly to be emphasized that sp. surface cannot be detd. by ultramicroscopic measurements. Various aspects of the problem are discussed, in part mathematically, including the prepn of samples, the relation of particle shape to av. diam. and diffraction effects. Eleven references to closely related work are appended. C. C. DAVIS

An apparatus for the separation of grit and coarse particles from fine powders. G. GALLIE AND B. D. PORRITT. *Trans. Inst Rubber Ind.* **2,** 116–9(1926).—An app is described and illustrated which was designed to overcome the errors inherent in the simple sieve test and to remove completely the personal factor. In principle it consists

of suspending the powder in water and furnishing a gentle stream of water to wet the powder and maintain the vol. of liquid in the funnel-shaped app. const., and a high-pressure jet of water to break up aggregates and keep the liquid in motion. C. C. D.

Detection of grit and rubber pigments. E. A. MURPHY. *Trans. Inst. Rubber Ind.* **2**, 100–6(1926).—Though elutriation is not so simple a method as a sieve test for detg. the grit in pigments, nevertheless for some pigments it gives more reliable results. An app. is described and illustrated, which has an elutriating tube used by Lowry (cf. *C. A.* **16**, 3016) but modified in form. Only coarse powders such as barytes can be elutriated with water and finer ones must first be dispersed in a medium such as a soln. contg. 0.5% NaOH and 0.1% glue, which is then used for elutriation. Because of the tendency to form agglomerates, substances such as lithopone give a residue which is not true grit, but which on the other hand may also fail to disperse in rubber. Therefore the elutriation test even in this case may give a better indication than the sieve test of the behavior of a pigment in rubber. The difficulty in dispersing lithopone may account for its poor reënforcing properties compared with ZnO. C black cannot be elutriated. For general routine analysis the new method of Gallie and Porritt (cf. preceding abstr.) is to be preferred and is highly recommended. C. C. DAVIS

Is there a substitute for American carbon black? WM. B. WIEGAND. *India Rubber J.* **72**, 385–8(1926).—Comparative tests of 2 grades of lampblack and a gas black in typical rubber mixts. designed to withstand abrasion show the superiority of the vulcanized mixts. contg. gas black. This superiority was manifest in the tensile strengths, elongations at rupture, resilient energies and resistances to abrasion. C. C. DAVIS

Some observations on rubber-proofed garments and adhesive rubber solutions. WERNER ESCH. *Gummi-Ztg.* **40**, 2697(1926); *India Rubber J.* **72**, 499–501(1926).—Wide experience in the manuf. of rubberized cloth has led to certain observations from which certain conclusions may be drawn. Fabrics should be free from Cu, Mn and salts having an acid reaction, *e. g.*, Fe salts, and should contain not over 1.5% grease or oil Rubber solns. should contain only dry rubber, with a low resin content, previously milled for about 0.5 hr. at 70–80°, and dissolved in dry benzene or benzine. The best solns. contain only benzine or benzene (or a mixt.) distg. completely below 100°; for less important uses benzine distg. up to 120° may be used. Water in such solns is an adulterant and is particularly objectionable when rosin is also present. The addn. of rosin increases the apparent tackiness but reduces seriously the adhesive power, and is highly objectionable. Proofing compds. for raincoats should be wholly free of Mn, Cu, sol. Fe salts and Pb compds. sol. in HOAc, should contain not over 5% brown factice, and should contain enough MgO to neutralize any free acid formed. Factice for such use should not be made of mixed oils and preferably should be prepd. from pure rape oil. Rape-oil factice improves the aging properties and reduces the quantity of benzine required. C. C. DAVIS

Some points in connection with the manufacture of rubber. T. E. H. O'BRIEN. *Trop Agr.* (Ceylon) **66**, 283–6(1926).—Coagulants and means for preventing mold are discussed. A. L. MEHRING

Fertilizing rubber gardens in Java. A. J. ULTEE. *Trop. Agr.* (Ceylon) **67**, 31–6 (1926).—Fertilization of *Hevea* trees had no noticeable effect on the production or quality of latex or on the resistance to disease shown by the trees. A. L. MEHRING

Reclaiming rubber from tire stock. ANON. *Chem. Met. Eng.* **33**, 527–8(1926).—An illustrated description of modern industrial developments. C. C. DAVIS

The electrical precipitation of rubber on metals and wood. FRANZ MEYER. *Korrosion* **1**, 21–2(1926); cf. Elliot, *C. A.* **20**, 2622. J. H. MOORE

The acceleration of vulcanization in theory and practice. FRIEDR. EMDEN. *Kautschuk* **1926**, 137–8, 180; cf. *C. A.* **20**, 2919.—Various patented accelerators are described, with 44 references, chiefly to patents. C. C. DAVIS

Vulcanization and accelerators. ANDRÉ DUBOSC. *Rubber Age* (N. Y.) **15**, 92–4, 133–5, 219–21, 259–61, 305–6, 344–5, 385–6, 426–7, 459–61(1924); **16**, 51, 53, 119–20, 154–6, 192–3(1924); **16**, 264–5, 335–6, 370–1, 408–9(1925); **17**, 23–4, 60–1, 96–7, 132–3, 168–9, 240–1, 272–3, 308–10, 341–2, 376–7(1925); **18**, 24–5, 129–30, 165–6(1925); **19**, 104–5, 144–5, 353–4(1926).—A monograph in the form of a series of articles comprising a crit. review and discussion of the various theories of vulcanization proposed in the past, of the role of different non-rubber substances naturally present or added artificially to rubber, and other closely related subjects pertaining directly or indirectly to the mechanism of vulcanization. The published work of numerous investigators is reviewed in great detail and in some cases expts. hitherto unpublished are described as a means of supporting the point of view in question. C. C. DAVIS

The use of furfural in rubber manufacture. C. S. Miner. *Rubber Age* (N. Y.) **19,** 565–6(1926).—A description of the chem and industrial history of furfural, its production and properties, and derivs. of interest to the rubber industry. C. C. D.

Furfural derivatives as rubber accelerators. J. P. Trickey and G. J. Leuck. *Ind. Eng. Chem.* **18,** 812–3(1926); *India Rubber J.* **72,** 383–4(1926); *India Rubber World* **74,** 328–9(1926).—From furfural may be prepd. derivs. which have a marked accelerating action, varying from the ultra type to those having only a weak activity. In general, derivs. prepd. from aromatic compds. have a relatively low accelerating activity and those from aliphatic compds. a relatively great activity. Expts. were carried out and data are given to show the accelerating activity of hydrofuramide, furfurine, the condensation products of furfural with $PhNH_2$, Ph_3N and $PhNMe_2$, two types of the compd. $(C_4H_3O\ CHS)_3$, ethylfurylamine, furylideneethylamine, dithiofuroic acid, Zn dithiofuroate and Pb dithiofuroate. Some of the tests are compared with tests of hexamethylenetetramine and diphenylguanidine. Hydrofuramide and furfurin, so far the best known of the derivs , were found to be approx. $^1/_3$–$^1/_2$ as active as hexamethylenetetramine or diphenylguanidine. Also in abridged form in *Chem. Trade J.* **74,** 221–2(1926). C. C. Davis

Sulfur determination in vulcanized rubber. P. Dekker. *Chem. Weekblad* **23,** 369–75(1926) —The methods used in different countries for detn. of free and bound S have been compared. For free S the Dyer and Watson method (*C. A.* **16,** 3557), the Am. Chem Soc. method (*C. A* **18,** 1763), the German method (*Chem.-Ztg* **47,** 19(1923)) give equally good results. Byam's method (*India Rubber J.* **66,** 678(1922)) is rather cumbersome For routine work the American method is preferred, if the S content is very high the old Dutch method is used (acetone ext. boiled with HNO_3(d 1.4), S detd in soln as $BaSO_4$, undissolved residue directly weighed as free S). For total and for combined S the methods of (*a*) Stevens (*C. A.* **13,** 1030), (*b*) Pearson (*C. A* **15,** 960), (*c*) Dyer and Watson, (*d*) Munro (*C. A.* **14,** 1908), (*e*) Kratz, Flower and Coolidge (*India Rubber World* **61,** 556(1920)), (*f*) Waters and Tuttle (cf. Collier, *C. A.* **17,** 3807) were examd Method *a* is impractical; *b* and *c* give low results; *d* is not dependable, *e* and *f* are most useful Method *e* is recommended for elastic rubber (up to 10% combined S), method *f* for ebonite and rubber-S mixts with high free S. A slight improvement on the results of *e* could be obtained by addition of Br to the $Zn(NO_3)_2$ digestion. In the Parr S bomb combustion method difficulties were experienced, mainly due to corrosion of the bomb material. The ter Meulen-Heslinga (*C. A.* **16,** 2094) reduction method is accurate, but impractical on account of the small sample (10 mg.) used. B. J. C. van der Hoeven

Future commercial prospects for synthetic rubber. Wm. C. Geer. *Ind. Eng. Chem.* **18,** 1136–7(1926) —Chemically the prospects are good, but from an economic standpoint there is little chance of synthetic rubber becoming of com. importance. Moreover the raw materials from which it might be produced have other vital uses and are irreplaceable C. C. Davis

The direct use of rubber latex, especially vulcanized latex. Philip Schidrowitz. *Ind. Eng. Chem.* **18,** 1147–52(1926) —A detailed historical survey of published work on the direct use of latex, either raw or vulcanized, in the manuf. of rubber goods, including its use in tires, mech goods, ebonite, proofing, thread, dipped goods, paper, fibers, artificial silk, paints, adhesives, casein products, molded goods, etc. (cf *C. A* **20,** 2595). The concn. of latex, the vulcanization of latex and the general properties of vulcanized latex are also described, with a comparison of raw and vulcanized latex rubber. The manuf. of goods from and with vulcanized latex is in com. operation in England and the process is no longer in the lab. stage. Numerous references, chiefly to patents, are included. C. C. Davis

Cinematomicrographs of Brownian movement in rubber latex and of the dissection of single latex particles with the micromanipulator. E. A. Hauser. *Ind. Eng. Chem.* **18,** 1146–7(1926).—A descriptive text (by Geo. L. Clark), with representative reproductions, of a cinematomicrograph by H. portraying (1) the Brownian movement in unvulcanized and vulcanized latex, and (2) the puncturing and dissection of individual globules by means of a specially designed micromanipulator. C. C. Davis

Antioxidants and their retarding action in the deterioration of rubber. L. E. Weber. *Ind. Eng. Chem.* **18,** 963–4(1926); *India Rubber J.* **72,** 503–4(1926).—A review and discussion of the oxidation theory of deterioration and its inconsistencies, the antioxidizing action of accelerators, the function of antioxidants and their com. use. C. C. Davis

The preparation of smoked sheets. Estate factory practice in Sumatra. H. N. Blommendaal. *India Rubber J.* **72,** 429–34, 464–6(1926).—An illustrated description of current practice, dealing in detail with the receiving of the latex, straining, mixing

tanks, anti-coagulants, the coagulation process, smoking and finishing of the sheet rubber and the latest types of equipment. C. C. Davis

Heat-resistant vulcanized rubber mixtures. Werner Esch. *Gummi-Ztg.* **40,** 2862–3(1926).—Formulas recommended for inner tubes, air-bags, steam hose, hot-water bags and conveyor-belt covers are itemized. C. C. Davis

Recent developments in the preparation of plantation rubber. H. P. Stevens. *Ind. Eng. Chem.* **18,** 1116–21(1926).—A comprehensive crit. review and discussion. No radical changes in the methods of prepg. plantation rubber are foreseen, for as a whole present methods are correct in principle and yield a satisfactory product. The most to be expected is an improvement in the details of prepn. and the production of sheet and crepe rubber of greater uniformity and freedom from mold, spots and minor defects. Alum is not so bad a coagulant as has been suggested, for it has no particular disadvantage except for its tendency to retard the rate of cure, and this may be counterbalanced by allowing the rubber to mature. H_2SO_4 also retards the rate of cure, but in small amts., *e. g.*, 1 part per 2000 of latex, this effect is slight. Quant. data are given to show the influence of alum, H_2SO_4 and HOAc on the rate of cure. No other deleterious action can be ascribed to H_2SO_4, and sheet rubber coagulated with H_2SO_4 is in good condition 20 yrs. later. H_2SO_4 thus differs from HCl or H_3PO_4, both of which cause tackiness. Na_2SiF_6, though a fungicide, has failed to prevent the growth of mold, but it has proved of great value in preventing gaseous fermentation in latex arising from bark molds or bacteria, thus allowing the prepn. of bubble-free sheet rubber from infected latex. Only $^1/_3\%$ on the rubber content of the latex is necessary. Because of its new cheap production and its greater coagulating power, it is predicted that HCO_2H may gradually replace HOAc as the most widely used coagulant. Light dry molds do not influence the rate of cure or other properties of sheet rubber. If however, the sheets are moist with a close damp mold, the rate of cure is usually slower, particularly with PbO, because the molds consume the natural fatty acids of the rubber. The addn of stearic acid to mixts contg. moldy rubber is therefore advisable. A similar slowly curing though superficially clean rubber may be the result of invisible internal mold. Vulcanization tests of the moldy portions of crepe with spotty mold show that they have a slower rate of cure than the clean portions. Of all the fungicides tested, the most effective and promising are *p*-nitrophenol and 3,5-dinitro-*o*-cresol, and confirmatory tests of sheet and crepe contg. *p*-nitrophenol (0.1% of the rubber) by American manufacturers show favorable results. These 2 compds. enable the marketing of clean unsmoked sheet. Properly prepd. air-dried crepe is as good in quality as sheets and it is more uniform. The drying of crepe, the characteristics of "whole latex" rubbers, the production of very pale crepe by fractional coagulation, the methods of prepn. and the characteristics of sheet rubber, the rolling process, scrubbing and smoking and packing are also discussed, besides other subjects which are published elsewhere C. C. Davis

Developments in the Netherlands Indies rubber-planting industries. Otto de Vries. *Ind. Eng. Chem.* **18,** 1129–31(1926).—A crit. review of present developments, most of which have been described elsewhere. For most uses plantation rubber is now so good that the manufacturer should direct his attention to a systematic study of mastication and the control of plasticity. Indications point to the production for the most part of a cheap, uniform, inherently good rubber, and a relatively small quantity of special types, such as very pale crepe, certificate rubber with a particularly uniform rate of cure, rubber contg. a min. amt. of serum substances, etc. C. C. Davis

Botanical and chemical developments in the plantation industry. J. W. Bicknell. *Ind. Eng. Chem.* **18,** 1109–13(1926).—A survey of present developments, including the difficulties of field experimentation, the control of tree diseases, the yields of latex under different conditions, budding, tapping and results obtained with artificial fertilizers. C. C. Davis

Possibilities of wild and plantation rubber production in tropical America and Africa. H. N. Whitford. *Ind. Eng. Chem.* **18,** 113–6(1926).—Economics. C. C. Davis

The botany and cultural problems of guayule. Wm. B. McCallum. *Ind. Eng. Chem.* **18,** 1121–4(1926).—The subjects include the botany and general characteristics of the shrub, its rubber and resin content, cultivation problems, the germination of seeds, production of seedlings on a large scale and the maintenance of a high rubber content. C. C. Davis

The production of guayule rubber. Geo. H. Carnahan. *Ind. Eng. Chem.* **18,** 1124–6(1926).—Economics. C. C. Davis

The chemistry of guayule. David Spence. *Ind. Eng. Chem.* **18,** 1126–8(1926).—The difficulties encountered in the past in prepg. and utilizing guayule rubber have been overcome and a rubber can now be prepd. by simple means which compares

favorably in its vulcanizing properties and in its quality in the cured state with high-grade plantation rubber. The mech. process of prepn., which is described in detail is economically superior to the solvent extn. process and it is now the usual com. mode of prepn. A good av. shrub yields 14–16% rubber (dry basis), the rubber contg. in turn about 22% Me_2CO-sol. substances and traces of ethereal oils, N and insol. residue. The yields of rubber and its Me_2CO-sol. components however vary with the variety of shrub, its age, the nature of the soil, etc. Selected varieties (Cal.) have yielded up to 22% pure rubber. The Me_2CO-sol. components can be reduced to less than 0.5 their normal amt. by boiling 2% aq. NaOH. Complete elimination is however probably undesirable on account of the adverse influence on the properties of the rubber for most uses. The rapid deterioration in quality and diminished yield of rubber on storage when not removed from the shrub have generally been ascribed to oxidation. This could not be substantiated. The Me_2CO-ext. is actually lower in the deteriorated rubber, and phys. changes in the colloidal state, involving depolymerization, are more probable. The tendency to deteriorate can be retarded and improvements in the quality of the rubber can be realized by proper treatment of the harvested shrub.
C. C. Davis

Preparation of synthetic rubber hydrocarbon (Calvert) **10.** Thermostatic control device for vulcanizing apparatus (U. S. pat, 1,601,408) **1.** Waterproofing cement mixtures, etc., with rubber latex (Brit pat. 242,345) **20.** Thiazoles (U. S. pat. 1,591,440) **10.**

Rubber compositions. C. O. North. U. S. 1,602,624, Oct. 12. $(NH_4)_2CO_3$ or other suitable heat-decomposable material is suspended in a liquid boiling above 100°, *e. g.*, a petroleum oil, and this suspension is added to plasticized rubber on the mixing mills, to produce semi-hard sponge rubber.

Rubber compositions. A. B. Cowdery. Brit. 243,384, Nov. 22, 1924. An ingredient of rubber compns. consists of the residue obtained by distg. coal tar until a large proportion of the volatile constituents is removed and the residue contains about 60% free C and has a m. p. of about 175–250° and a sp. gr. of 1.30–1.35. Natural gas may be used to facilitate the distn. of the tar and the residue is finely ground and milled into the rubber. The material has less coloring effect than C black and up to 15% of it may be added to tan-colored shoe heels or soles.

Rubber compounds. R. Russell and H. Broomfield. U. S. 1,601,772, Oct. 5. See Brit. 231,988 (*C. A.* **19,** 3617).

Coloring rubber. H. Lindemann. Brit. 243,605, Apr. 21, 1925. Sponge rubber having fine pores is sprayed with colored latex or colored solns. or emulsions of rubber A method of forming rubber with small pores is described.

Coloring rubber. Gummiwaren-Fabrik M. Steinberg. Brit. 242,900, April 17, 1925. In forming dipped rubber articles, a bath with a color-patterned upper layer is used, to produce a surface of mottled or marbled design.

Joining hard and soft rubber. W. A. M. Valon and Paragon Rubber Manufacturing Co., Ltd. Brit. 242,687, July 12, 1924. In forming battery boxes or other articles of united hard and soft rubber, an accelerator is incorporated in the compn. forming the hard rubber and vulcanization of the hard and soft rubbers is effected together in a single operation.

Composition for shoe heel treads, etc. B. W. Rote. U. S. 1,601,327, Sept. 28. Cotton fiber 70, Para rubber 15, PbO 5, MgO 5, gloss black 3 and S 2 parts are formed into vulcanized sheets.

Concentrating latex on a rotary drum or similar apparatus. K. D. P., Ltd. Brit. 243,016, Nov. 14, 1924.

Vulcanizing rubber. L. B. Sebrell. U. S. 1,591,439, July 6. Compds. such as 2-mercapto-4-phenylthiazole or its Zn, Pb, Cd, Hg or other metallic salts or corresponding thiazyl disulfides and polysulfides are used as accelerators. U. S. 1,591,441 specifies the use of similar compds. in which a H atom may be present instead of the Ph group. 2-Mercapto-4-methylthiazole also is referred to for use with S and ZnO. Cf. *C. A.* **20,** 3590.

Vulcanizing rubber. S. J. Peachey and A. Skipsey. Brit. 242,464, Dec. 9, 1924. Can. 264,042, Sept. 7, 1926. Rubber vulcanized by means of sulfides of P is subjected to an after-treatment with NH_3, either in gaseous form or in soln.

Devulcanizing rubber. C. F. Willard. U. S. 1,602,062, Oct. 5. Vulcanized rubber is devulcanized by boiling in a emulsoid colloid soln. such as tar, rosin, pitch, gum or balsam soln. and a S solvent, *e. g.*, turpentine, and after devulcanization the boiling is continued to dissolve the rubber. Cf. *C. A.* **20,** 3590.
